Appendix D: Glossary	69
Appendix E: Acronyms	71

1. Introduction

Communities across the nation are seeing a change in the hazards they face. Extreme weather events are becoming more frequent and more severe. Because certain disasters, such as floods and wildfires, are occurring in new places or during different times of the year, communities can no longer plan for future incidents solely based on what has happened in the past. The changing hazard landscape means emergency managers need to plan differently when assessing disaster risk and community resilience. To be more prepared, communities should examine the changing environment, understand how future hazards may impact their community, and factor that information into their planning efforts.

1.1. Purpose

The *Climate Adaption Planning Guidance for Emergency Managers* (this guide) is intended to help state, local, tribal, and territorial (SLTT) emergency managers incorporate climate adaptation into emergency management planning efforts. It discusses climate science in the context of disaster preparedness and explains how emergency managers can help communities develop effective climate adaptation strategies. Communities may use different terminology around climate resilience and climate adaptation efforts, but for the context of this guide, the terminology will be subsequently referred to as “climate adaptation planning.”

Climate Adaptation Planning

For the purpose of this guide, climate adaptation planning is defined as a systematic approach used to identify the threats and hazards that might impact a community given plausible future climatic conditions. The process involves assessing the risk posed by these threats or hazards and positioning the community to avoid or minimize the consequences of climate-related disruptions.

This introductory section provides an overview of this guide and definitions of key terms. [Section 2](#) provides an overview of climate science, regional impacts, and potential tools for climate modeling. [Section 3](#) presents an overview of climate adaptation planning, [Section 4](#) follows the six step planning process based on [Comprehensive Preparedness Guide \(CPG\) 101: Building and Maintaining Emergency Operations Plans](#)¹ and explains the information and actions for each step. Section 2 can be read as reference material whereas Sections 3 and 4 provide potential best practices emergency managers can take to plan around climate change, along with case studies. At the end of each section and step are key takeaways for emergency managers. The Appendices provide potential cascading impacts on response and recovery planning, more details on useful climate modeling tools, resources for financing climate resilience, and a glossary and acronym list.

¹ The Federal Emergency Management Agency (FEMA), *Comprehensive Preparedness Guide 101: Developing and Maintaining Emergency Operations Plans, Version 3.0* (2021).
https://www.fema.gov/sites/default/files/documents/fema_cpg-101-v3-developing-maintaining-eops.pdf

35 1.2. Key Terms and Considerations for Climate Adaptation Planning

- 36 ▪ **Adaptation:** Adjustment in natural or human systems to a new or changing environment that
37 exploits beneficial opportunities or moderates negative effects.²
- 38 ▪ **Climate mitigation (may also be called “mitigation” or “greenhouse gas mitigation”):**
39 Measures to reduce the amount and speed of future climate change by reducing emissions
40 of heat-trapping gases or removing carbon dioxide from the atmosphere.³
- 41 ▪ **Community risk analysis:** Understanding potential risks and the actions needed to address
42 those risks by answering: 1) Which threats and hazards may affect our community? 2) If they
43 occur, what impacts would those threats and hazards have on our community? 3) Based on
44 those impacts, what capabilities should our community have in place?⁴
- 45 ▪ **Equity:** The consistent and systematic fair, just, and impartial treatment of all individuals,
46 including individuals who belong to underserved communities that have been denied such
47 treatment, such as Black, Latino, and Indigenous and Native American persons, Asian
48 Americans and Pacific Islanders and other persons of color; members of religious minorities;
49 lesbian, gay, bisexual, transgender, and queer (LGBTQ+) persons; persons with disabilities;
50 persons who live in rural areas; and persons otherwise adversely affected by persistent
51 poverty or inequality.⁵
- 52 ▪ **Hazard mitigation:** Any sustained action taken to reduce or eliminate the long-term risk
53 to human life and property from hazards.⁶
- 54 ▪ **Nature-based solutions (NBS):** The sustainable planning, design, environmental
55 management, and engineering practices that weave natural features and processes into the
56 built environment to promote adaptation and resilience.⁷
- 57 ▪ **Resilience:** the ability to prepare for threats and hazards, adapt to changing conditions, and
58 withstand and recover rapidly from adverse conditions and disruptions.⁸
- 59 ▪ **Risk:** Threats to life, health and safety, the environment, economic well-being, and other
60 things of value. Risks are often evaluated in terms of how likely they are to occur (probability)
61 and the damages that would result if they did happen (consequences).⁹

62 Effective planning takes time and includes anticipation of the future (e.g., conditions, infrastructure,
63 impacts) and proactive integration with other plans. Too often, planning occurs in silos which leads
64 to conflicting community plans, especially in light of planning for a future with climate change. An
65 example of this would be an economic development plan that identifies a waterfront district for
66 expansion, which may conflict with a climate adaptation plan calling for greenspace in the area due
67 to sea level rise. Furthering these climate change planning challenges, communities may be
68 resource constrained or have historically suffered from inequality. Through efforts such as hazard
69 mitigation and disaster recovery planning, emergency managers are in a key position to help bring
70 different parts of the community together to harmonize long term strategies that address climate
71 adaptation as well as day-to-day planning challenges.

72 While emergency managers often shorten the phrase “hazard mitigation” to “mitigation,” in the
73 climate discipline, “mitigation” often refers to climate mitigation (see callout box below). Climate
74 mitigation seeks to reduce future climate change by limiting greenhouse gas (GHG) emissions.
75 However, climate adaptation and hazard mitigation share a common goal of minimizing impacts from
76 natural hazards that are expected to increase in frequency and intensity due to climate change.

77 Climate adaptation is especially concerned with adjusting to future conditions and building resilience
78 to withstand those changes. As the future climate is variable and may present new challenges,
79 climate adaptation uses scenarios to help plan for uncertainty. Adaptation is also a process that
80 continues over time, responding to new information or climate conditions. Successful climate
81 adaptation solutions can vary depending on the scope of the action but often include changes in
82 processes, behaviors, and infrastructure.

83 **Hazard Mitigation versus Climate Mitigation**

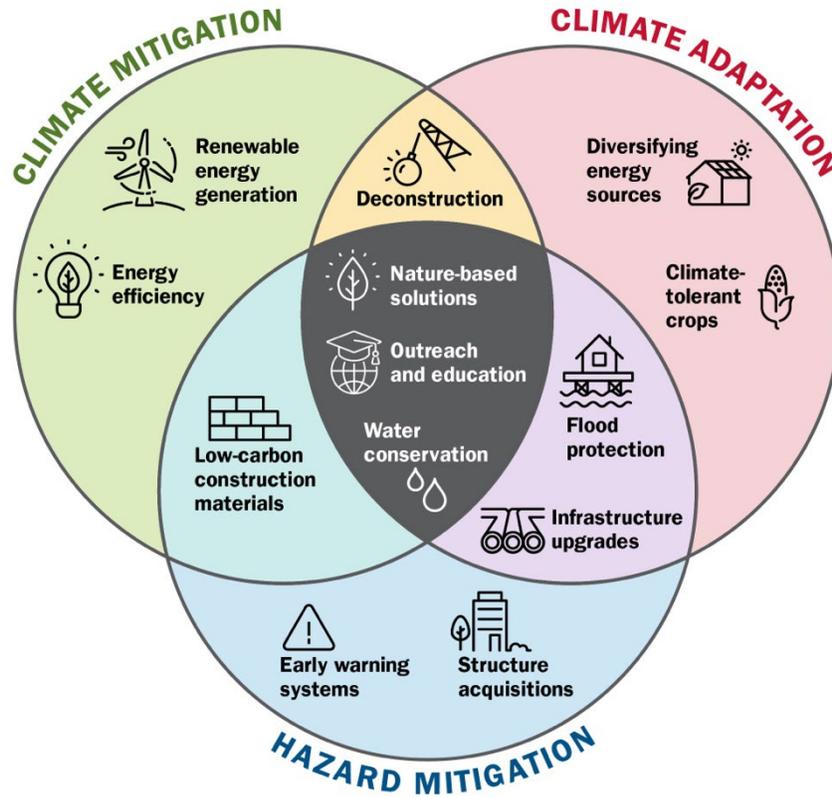

84 Hazard mitigation is *any* sustainable action to reduce or eliminate long-term risk to people and
85 property from future disasters. Climate mitigation is the reduction of GHG emissions and levels
86 in the atmosphere to reduce the severity of human-caused climate changes.

87 Hazard mitigation and climate adaptation help communities reduce the risk of damage caused by
88 natural disasters. They can also shorten recovery time by building communities that are more
89 resilient and prepared for current and future hazards. Hazard mitigation and climate adaptation are
90 essential because the effects of climate change are happening now and are expected to worsen.¹⁰

91 As all-hazards planners, emergency managers may already consider the impacts of climate change
92 through [hazard mitigation planning](#).¹¹ By adding climate adaptation planning, emergency managers
93 can help promote climate resiliency across plans while supporting underserved populations and the
94 whole community (see [Figure 1](#)).

95

96
97

Figure 1: Climate Resilience through Climate Mitigation, Hazard Mitigation and Climate Adaptation

98

Key Takeaways for Emergency Managers: Introduction

99
100

- Extreme weather events are becoming more frequent and intense, and thereby costlier due to climate change.

101
102
103

- It is important to understand key terms commonly used in climate adaptation planning, specifically the differences between hazard mitigation, climate mitigation, and climate adaptation. Refer to [key terms](#) on page 2.

104
105

- Climate adaptation planning seeks to assess climate-related hazards, develop courses of action to mitigate risk, and devise strategies for responding to climate-related disruptions.

106
107
108
109
110

- Emergency managers can help communities develop effective hazard mitigation and adaptation strategies to become more resilient to the impacts of climate change. They are in a key position to help bring different parts of the community together to harmonize long term strategies that address climate adaptation as well as day-to-day planning challenges in a comprehensive way.

111

112 2. Climate Science for Emergency Managers

113 Climate science investigates the structure and dynamics of Earth’s climate system. It seeks to
 114 understand global, regional, and local climate characteristics as well as the processes that influence
 115 change over time. Climate science is similar to the academic discipline of emergency management
 116 in that it draws on a number of scientific fields including meteorology, oceanography, physics,
 117 chemistry, environmental science, informatics, and computer science. Climate scientists are
 118 increasingly working with engineers and social scientists across disciplines to understand and
 119 explain how changing climatic conditions will impact individuals, communities, economies, and
 120 infrastructure systems. This section of this guide defines the science of climate change and its
 121 potential impacts, provides potential data tools for analyzing climate change, and introduces
 122 communication strategies needed to build climate-resilient communities.

123 2.1. Understanding Past and Potential Future Climate Conditions

124 Climate change is a broad term that can
 125 cover changes in multiple parts of the
 126 climate system, from temperature to
 127 precipitation to wind patterns. A region’s
 128 climate provides the background
 129 conditions that give rise to a location’s
 130 weather events. Thus, *climate* can be
 131 described as the “average weather” for an
 132 area; it refers to the average of the
 133 meteorological conditions and weather
 134 patterns that occur over long time periods.

135 Through geologic time, Earth’s climate has
 136 varied, reflecting the complex interactions
 137 and dependencies of the solar, oceanic,
 138 terrestrial, atmospheric, and living
 139 components that make up Earth’s systems.
 140 Earth experiences long cycles of warming
 141 and cooling that span tens of thousands to
 142 100,000 years in length. The cycles are
 143 influenced by regular changes in Earth’s
 144 orbit that alter the intensity of the solar energy that the planet receives, absorbs, and reflects.
 145 Earth’s climate has also been transformed over a long timescale by changes in atmospheric
 146 chemistry and ocean circulation. It has also changed due to sudden events, such as massive
 147 volcanic eruptions.

148 The rate of climate change in the 20th century and early 21st century stands out in the geological
 149 record as extremely rapid, especially relative to the last 10,000 years. Since the year 1900, global

Climate versus Weather

Weather refers to short-term atmospheric conditions while climate is the weather of a specific region averaged over a long period of time. Climate change refers to long-term changes.

The infographic is titled "WEATHER vs CLIMATE". On the left, under "WEATHER", it shows a clock icon and text: "Short-term atmospheric conditions over a period of hours to weeks". Below this is a weather forecast for Monday through Friday with icons for clouds, sun, clouds, rain, and clouds with rain. On the right, under "CLIMATE", it shows a globe icon and text: "Long-term weather patterns over a period of a decade or more". Below this is a line graph showing temperature trends from 2020 to 2040. The y-axis represents temperature in degrees Fahrenheit, ranging from 55° to 70°. The x-axis represents years from 2020 to 2040. The graph shows a fluctuating but generally upward-trending line, starting around 60°F in 2020 and ending near 70°F in 2040.

150 temperatures have risen by approximately 2°F, and climate scientists expect Earth’s temperature will
151 continue to rise at an increasing rate throughout the 21st century.¹²

152 The key driver of climate change is the emission of gases that trap heat in the atmosphere,
153 commonly referred to as GHGs.¹³ These gases create a “greenhouse effect,” altering our climate by
154 warming the atmosphere through absorbing and reemitting infrared radiation while allowing
155 shortwave radiation to pass onto the Earth’s surface.¹⁴ Changes in land cover impact both weather
156 and climate by altering the concentration of GHGs and the exchange of energy between land and the
157 atmosphere. For example, reforestation can provide localized cooling, even as continued warming is
158 expected for the planet as a whole and most regions on Earth. Furthermore, in urban areas,
159 continued warming is expected to exacerbate due to the urban heat island effect.¹⁵

160 **Greenhouse Gases**

161 GHGs are gases that trap heat and solar radiation in Earth’s atmosphere rather than allowing it
162 to escape into space. This process of heating the atmosphere is known as the *greenhouse*
163 *effect*. GHGs include carbon dioxide, methane, ozone, nitrous oxide, and industrial gases. Except
164 for industrial gases, all are naturally occurring and are important for regulating Earth’s
165 temperature. Human activities have increased the amounts of carbon dioxide, methane, nitrous
166 oxide, and industrial gases in the atmosphere, creating an imbalance in the complex system of
167 feedback loops in Earth’s warming atmosphere and leading to changes in the climate.

168 The types and severity of change in our climate depend on how much GHGs have built up in the
169 earth’s atmosphere. These gases have fluctuated over geologic time, yet human activities since the
170 Industrial Revolution, most notably fossil fuel burning, have exponentially increased the release of
171 CO₂ emissions, resulting in a higher concentration of heat-trapping GHGs and an increase in Earth’s
172 average surface temperature (see [Figure 2](#)).¹⁶ As it is not possible to determine exactly what future
173 GHG emissions will be, climate scientists create multiple estimates based on various assumptions to
174 identify a range of possible human activity scenarios. These scenarios are called Representative
175 Concentration Pathways (RCPs) and denote the estimated concentration of GHG that could build up
176 in the atmosphere.¹⁷

177
178

Figure 2: Atmospheric Carbon Dioxide Amounts and Annual Emissions (1750-2021)¹⁸

179 The [Intergovernmental Panel on Climate Change](#) (IPCC)¹⁹ uses RCPs for climate modeling scenarios
180 that reflect change since the pre-industrial era. Each RCP is based on different assumptions related
181 to policy decisions and individual behaviors that will either decrease, maintain, or increase future
182 GHG emissions.

183 [Table 1](#) and [Figure 3](#) show the estimated impact of three scenarios on global temperature.²⁰

184 **Table 1: Representative Concentration Pathway (RCP) impacts on Global Temperature by 2100**

RCP	Scenario	Global Mean Surface Temperature Increase in 2081-2100 Relative to 1986-2005 Time Period ²¹
RCP2.6	Lowest: Assuming carbon emissions from fossil fuels have already peaked.	0.5° - 3.0° F (0.3 - 1.7° C)
RCP4.5	Low or Intermediate: Fossil fuel carbon emissions peak mid-century then decrease.	2.0° - 4.7° F (1.1 - 2.6° C)
RCP8.5	Highest: Fossil fuel carbon emissions continue to increase throughout the century.	4.7° - 8.6° F (2.6 - 4.8° C)

¹⁸ NOAA, *Climate Change: Atmospheric Carbon Dioxide*. <https://www.climate.gov/news-features/understanding-climate/climate-change-atmospheric-carbon-dioxide>.

¹⁹ The IPCC is an intergovernmental body of the United Nations responsible for advancing knowledge on climate change. It provides objective and comprehensive scientific information on climate change, including the natural, political, and economic impacts and risks as well as possible response options. It does not conduct original research nor monitor climate change, but rather undertakes a periodic, systematic review of all relevant published literature. Thousands of scientists and other experts volunteer to review the data and compile key findings into "Assessment Reports" for policymakers and the general public.

²⁰ The IPCC released its Sixth Assessment Report in 2023 (<https://www.ipcc.ch/report/ar6/syr/>), which offers an updated climate outlook and developed new GHG emissions scenarios called Shared Socioeconomic Pathways (SSP). The SSPs share many similarities with RCPs; however, since they are newer, many climate models still use the RCPs, including the resources listed in this document.

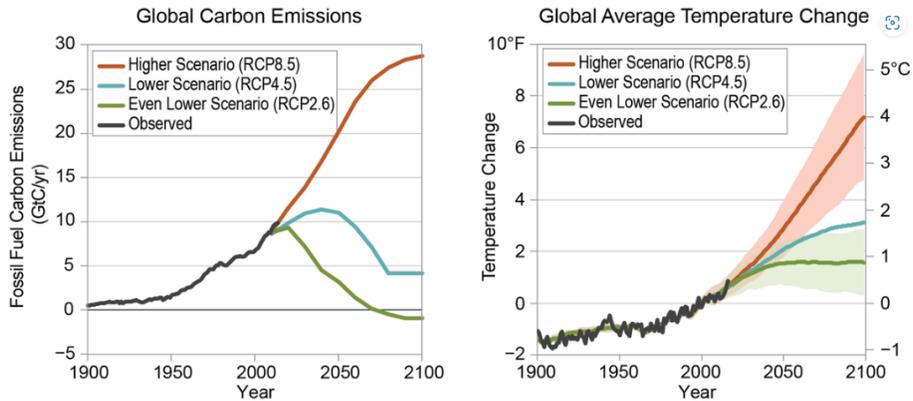

Figure 3: Carbon Emissions and Temperature Scenarios Based on RCPs²²

Many factors will influence future GHG concentration including carbon capture and renewable energy technology advancements, governmental and organizational policy decisions, consumer behavior, and the pace of modernization in developing countries. Emergency managers are encouraged to remain up-to-date with the current science to undertake climate-informed risk analysis, especially as it relates to climate change impacts specific to a geographic region (see [Regional Impacts Section](#)).

The National Oceanic and Atmospheric Administration (NOAA) monitors how global climate data changes through time in its [annual assessment](#) and reports results through several Climate Change Indicators on its [Global Climate Dashboard](#). Below are some of the NOAA Climate Change Indicators:

- **Annual Greenhouse Gas Index:** Tracks the combined warming influence of the long-lived trace gases in the atmosphere.
 - The amount of carbon dioxide in the atmosphere has risen by 25 percent since 1958 and by about 40 percent since the Industrial Revolution.²³
- **Global Surface Temperature:** Tracks temperature measurements taken at locations around the globe, which are converted from absolute temperature readings to temperature anomalies.
 - Global temperatures rose approximately 2 °F (~1 °C) from 1900 to 2022.²⁴
- **Global Sea Level:** Tracks sea level estimates provided through tide gauges and satellite altimeters.
 - Sea level rise has accelerated from 1.7 mm per year throughout most of the 20th century to 3.2 mm per year since 1993.²⁵

2.2. Climate Change Impacts

Climate change is affecting emergency management response and recovery actions due to the impacts of climate change on meteorological and climate-related hazards. Changing weather patterns will increase the severity, frequency, and impact of disasters. For example, the following list details hazards that are common in emergency management plans and provides examples of associated climate-related risk factors to consider:

- **Drought:** As temperatures climb, evaporation rates increase. In drought conditions, high evaporation rates will make droughts worse. Severe droughts can threaten drinking water supplies and supply chains, reduce industrial output, and disrupt agriculture.
- **Extreme Heat:** The annual number of very hot days is increasing. Extreme heat is now affecting areas of the country that are unfamiliar with this hazard. Of all weather-related hazards, extreme heat causes the highest number of deaths each year.²⁶
- **Coastal Flooding:** Rising sea levels are contributing to more frequent and intense coastal floods and storm surges, as well as recurring nuisance flooding.
- **Inland Flooding:** In many regions, more frequent and intense rains are leading to more severe flooding, especially during the heaviest events. Heavy rain can also trigger flash flooding and make rivers overflow. Saturated soils also create ideal conditions for landslides and mudslides.
- **Hurricanes:** Warming ocean waters are fueling larger and stronger tropical storm systems and weather conditions and increasing the likelihood of rapid intensification. The Gulf Coast, Southeast, and Mid-Atlantic are seeing more destructive hurricanes.
- **Wildfires:** Warmer temperatures are now more common, and intense droughts are creating the conditions for larger wildfires. Wet growing seasons, paired with dry periods, can lead to high fuel loads; warmer winter temperatures have allowed pests to decimate forest health, leading to massive amounts of dead wood on forest lands. All these factors create conditions for larger and more frequent wildfires and cascading smoke impacts.

This guide does not address all possible climate-related concerns and their potential impacts. As climate science remains an evolving discipline, there will be unknown impacts and unresolved questions related to climate change.²⁷ For example, some climate research links extreme cold events to Arctic warming due to its influence on the jet stream; however, this finding is not yet well determined. Such cold air outbreaks have resulted in significant impacts to people and infrastructure and should still be factored into planning.²⁸

243 **2.3. Regional Impacts**

244 Changing hazards will impact communities and regions differently. The hazards that regions and
 245 communities have previously been occasionally exposed to will become more frequent and severe,
 246 with new areas being affected as well. [Figure 4](#) outlines the top climate-related hazards for each
 247 region in the United States (U.S.). Note that this figure does not provide an exhaustive list of all
 248 climate-related hazards.

249

250

Figure 4. Regional Climate-Related Hazards²⁹

²⁹ Ibid. (Adapted figure).

251 For a comprehensive summary of climate-related risk for each region, see the [regional assessments](#)
252 [in the Fourth National Climate Assessment](#) and the [2022 State Climate Summaries](#).^{30,31} The next
253 section provides a breakdown of potential climate change impacts on communities by region.

254 2.3.1. POTENTIAL CLIMATE CHANGE IMPACTS BY REGION

255 *Northeast*.³²

- 256 ▪ The Northeast is experiencing warming temperatures and a large increase in the amount of
257 rainfall measured during heavy precipitation events.
- 258 ▪ Less distinct seasons, along with milder winters and earlier spring conditions, are already
259 altering environments in ways that adversely impact tourism, farming, and forestry.
- 260 ▪ More frequent heat waves in the Northeast are expected to increasingly threaten human health
261 through more heat stress and air pollution.
- 262 ▪ Sea level rise and more frequent heavy rains are expected to increase flooding and storm
263 surges, threatening infrastructure.
- 264 ▪ As temperatures rise, agriculture will likely face reduced yields, potentially damaging livelihoods
265 and the regional economy.

266 *Northwest*.³³

- 267 ▪ Climate change is projected to increase the risks from extreme events, including flooding,
268 landslides, drought, wildfire, and heat waves.
- 269 ▪ Climate change will likely result in continued reductions in snowpack and lower summer stream
270 flows in the Northwest, worsening the existing competition for water resources. Larger numbers
271 of rain on snow events will also lead to additional flooding.
- 272 ▪ Higher temperatures, changing stream flows, and an increase in pests, disease, and wildfires will
273 threaten forests, agriculture, and salmon populations.
- 274 ▪ Sea level rise is projected to increase the erosion of most coastlines, escalating infrastructure
275 and ecosystem risks.

276 *Southeast*.³⁴

- 277 ▪ Coastal communities in the Southeast are already experiencing warmer temperatures as well as
278 impacts from sea level rise, such as increased flooding.

³⁰ USGCRP, *Fourth National Climate Assessment: National Climate Assessment Regions* (2018).
<https://nca2018.globalchange.gov/chapter/front-matter-guide/>.

Note: Will update with Fifth National Climate Assessment for final publishing of this guide.

³¹ NOAA, *State Climate Summaries* (2022). <https://statesummaries.ncics.org/>.

³² USGCRP, *Fourth National Climate Assessment: Chapter 18: Northeast* (2018).
<https://nca2018.globalchange.gov/chapter/18/>.

³³ USGCRP, *Fourth National Climate Assessment: Chapter 24: Northwest* (2018).
<https://nca2018.globalchange.gov/chapter/24/>.

³⁴ USGCRP, *Fourth National Climate Assessment: Chapter 19: Southeast* (2018).
<https://nca2018.globalchange.gov/chapter/19/>.

- 279
- Higher temperatures and greater demands for water will strain water resources.
- 280
- Incidences of extreme weather, increased temperatures, and flooding will likely impact human
- 281
- health, infrastructure, and agriculture.
- 282
- Sea level rise is expected to contribute to increased storm surges and will increase the salinity of
- 283
- estuaries, coastal wetlands, tidal rivers, and swamps.

284 **Southwest**³⁵

- 285
- The most rapid observations of warming temperatures and reduced snowpack have been
- 286
- observed in recent decades in the Southwest.
- 287
- Increasing temperatures and more frequent and severe droughts are expected to heighten
- 288
- competition for water for urban/residential use, agriculture, and energy production.
- 289
- Indigenous populations are expected to experience difficulties associated with access to
- 290
- freshwater, the sustaining of agricultural practices, and declines in cultural plant and animal
- 291
- populations.
- 292
- Drought, wildfire, invasive species, pests, and changes in species' geographic ranges will
- 293
- increase threats to native forests and ecosystems.

294 **Midwest**³⁶

- 295
- Temperature increases in the Midwest have accelerated in recent decades, particularly
- 296
- increases in nighttime and winter temperatures.
- 297
- This region will likely experience warmer and wetter winters, springs with heavy precipitation, and
- 298
- hotter summers that have longer dry periods.
- 299
- Risks to human health are expected to rise as a result of warming temperatures, reduced air
- 300
- quality, and increased allergens.

301 **Great Plains**^{37,38}

- 302
- Warmer winters are altering crop growth cycles and will require new agriculture and management
- 303
- practices.
- 304
- Projected increases in temperature and drought frequency will further stress the High Plains
- 305
- Aquifer, the primary water supply of the Great Plains.
- 306
- Changes in water availability are likely to present challenges to agricultural irrigation and
- 307
- threaten key wetland habitats.
- 308
- Older residents in rural areas and Indigenous communities are especially vulnerable to the
- 309
- impacts of climate change.

310 ***Hawaii and Pacific Islands:***³⁹

- 311 ▪ Dependable and safe water supplies for Pacific Island communities and ecosystems are
- 312 threatened by rising temperatures, changing rainfall patterns, sea level rise, and increased risk
- 313 of extreme drought and flooding.
- 314 ▪ Warmer and more acidic oceans are stressing coral reefs and fish habitats.
- 315 ▪ Sea level rise is expected to threaten the water supplies, ecosystems, and infrastructure of U.S.
- 316 tropical islands.
- 317 ▪ Climate change is likely to affect the livelihoods of communities, as well as tourism and other
- 318 important economic sectors, on tropical islands.

319 ***U.S. Caribbean:***⁴⁰

- 320 ▪ Saltwater intrusion associated with sea level rise will reduce the quantity and quantity of
- 321 freshwater in coastal aquifers.
- 322 ▪ Sea level rise, combined with stronger wave action and higher storm surges will worsen coastal
- 323 flooding and increase coastal erosion.
- 324 ▪ Projected increases are expected in both average and extreme temperatures.

325 ***Alaska:***⁴¹

- 326 ▪ Extensive permafrost thaw is expected by the end of the 21st century, increasing the risk of
- 327 infrastructure damage.
- 328 ▪ Alaska is among the fastest warming regions on Earth, with temperatures warming twice as fast
- 329 as the global average since the middle of the 20th century.
- 330 ▪ Arctic sea ice is projected to continue to decline, with nearly ice-free periods possible by mid-
- 331 century.
- 332 ▪ Native Alaskans are expected to experience a declining availability of traditional foods and
- 333 reduced access to sea ice hunting grounds.

334 **2.4. Climate Change Impacts on People and the Economy**

335 Climate change is increasing the complexity, intensity, and frequency of disasters. According to
336 NOAA, there were 20 climate change-driven disasters with losses exceeding \$1 billion within the U.S.
337 in 2021.⁴² These events happened across all parts of the country and included droughts, floods,
338 severe storms, tropical cyclones, wildfires, and winter storms that resulted in the deaths of 724
339 people. 2021 was the third most costly year for weather and climate disasters in the U.S., with only
340 2005 (Hurricane Katrina) and 2017 (Hurricanes Harvey, Irma, Maria, and the California wildfires)

³⁹ USGCRP, *Fourth National Climate Assessment: Chapter 27: Hawai'i And U.S. Affiliated Pacific Islands* (2018).
<https://nca2018.globalchange.gov/chapter/27/>.

⁴¹ USGCRP, *Fourth National Climate Assessment: Chapter 26: Alaska* (2018).
<https://nca2018.globalchange.gov/chapter/26/>.

⁴² NOAA: National Centers for Environmental Information, *U.S. Billion-Dollar Weather and Climate Disasters* (2022).
<https://www.ncei.noaa.gov/access/billions/>, DOI: [10.25921/stkw-7w73](https://doi.org/10.25921/stkw-7w73).

341 causing more economic impact. As more people live in high-risk areas, climate adaptation planning
 342 can play a key role in reducing vulnerabilities of people, risk to the built environment, and economic
 343 impacts.

344 While climate change is expected to increase the frequency and severity of disasters over the coming
 345 century, its impacts are already being felt (see [Figure 5](#)). For example, in the 2010s there were on
 346 average 12.8 disasters per year in which damages reached at least 1 billion dollars. This is up from
 347 6.7 “billion-dollar disasters” per year in the 2000s.^{43, 44} The physical, economic, and social impacts
 348 from these disasters are not distributed evenly. Disadvantaged populations are more likely to be
 349 exposed to the worst disaster impacts and possess fewer resources to cope with the effects.

350
 351 **Figure 5: Trends in Billion-Dollar Disasters Events (Inflation-Adjusted)**

352 Rising global temperatures are the most observable impact of a changing climate resulting in
 353 significant impacts on the frequency, severity, and geographical distribution of natural hazards. A
 354 warmer atmosphere means more intense storms. The warmer atmosphere can hold more water
 355 vapor, which results in increasing precipitation levels and higher risk of flooding. More heat in the
 356 atmosphere and warmer ocean surface temperatures can lead to increased wind speeds in tropical
 357 storms. Rising sea levels caused by melting glaciers and the thermal expansion of the ocean expose
 358 coastlines to tidal flooding and greater storm surge.

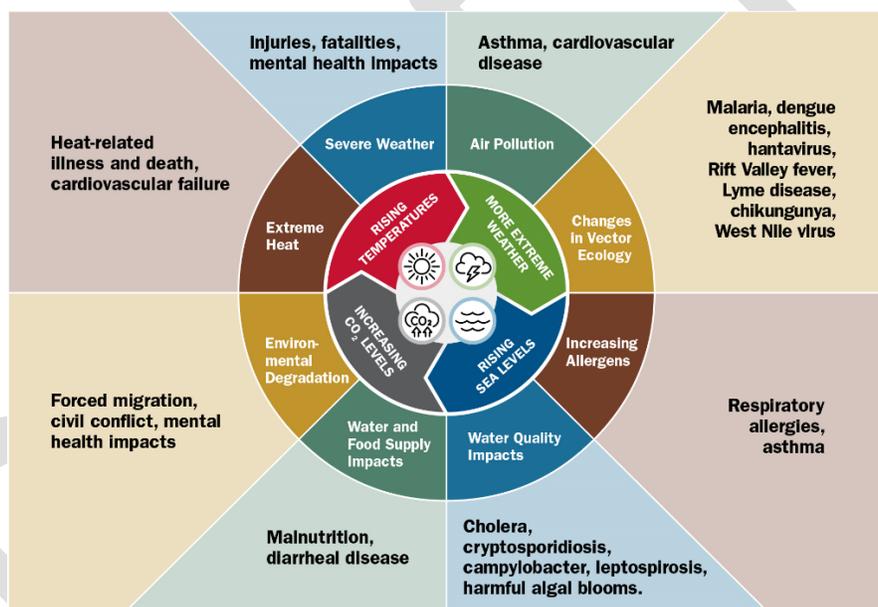

359 Shifting precipitation patterns can lead to more prolonged periods of drought while greater
 360 evaporation rates dry out soils and reduce surface water. Reduced snowpack limits the
 361 replenishment of reservoirs, creating water shortages and straining agriculture and livestock
 362 production. These conditions can cascade to produce an environment conducive to the spread of
 363 wildfire, with dry soils and vegetation as ample fuel for fires (for more in-depth examples of climate-
 364 related hazards with direct and cascading impacts, see [Appendix A](#)).

⁴³ Ibid.

⁴⁴ Annual billion-dollar events measurements are adjusted by the Consumer Price Index (CPI). The CPI is a measure of the average change overtime in the prices paid by urban consumers for a market basket of consumer goods and services. The CPI is a useful economic indicator, deflator of economic series, and a means to adjust dollar values.

365 Climate-related risks can compound with other hazards to create new threats or exacerbate existing
 366 ones. For example, long-term drought is accompanied by a greater risk of wildfire and wind erosion
 367 (e.g., the 1930s Dust Bowl). Coastal areas afflicted by riverine flooding as a result of intense
 368 rainstorms upstream may simultaneously experience a severe hurricane. This, in turn, could double
 369 the flooding impact and prolong the retreat of floodwater.

370 Climate change, together with other natural and human-made health stressors, also influences
 371 human health in numerous ways. Some existing health threats will intensify and new health threats
 372 may emerge. Not everyone is equally at risk and important considerations include age, economic
 373 resources, and location. Potential health effects of physical, biological, and ecological disruptions
 374 include increased respiratory and cardiovascular disease, injuries and premature deaths related to
 375 extreme weather events, changes in the prevalence and geographical distribution of food- and water-
 376 borne illnesses and other infectious diseases, and threats to mental health (see [Figure 6](#)).⁴⁵

377
 378 **Figure 6: Impact of Climate Change on Human Health**

379 These compounded climate threats may co-occur with other biological, technological, or economic
 380 threats. For example, extreme heat can reduce outdoor labor activities or damage infrastructure
 381 exposed to conditions beyond its design standards (e.g., melting roads, weakened bridges). All these
 382 hazards can directly and indirectly affect a community or region’s economy, creating new risks for
 383 agricultural or natural resource-dependent industries (e.g., skiing, fishing). Individuals and
 384 businesses can also suffer from direct climate hazard impacts. This can include damaged
 385 workplaces; lost income; reduced tax base; disrupted supply chains; destroyed infrastructure,
 386 including power or internet; and inability to access the job site due to a flooded or damaged road.

<https://www.cdc.gov/climateandhealth/effects/default.htm>.

387

Climate and Equity: Keeping Equity at Center of Climate Adaptation Planning

388
389
390
391
392
393
394

Underserved communities are disproportionately impacted by climate change and climate-driven hazards. For example, Black, Indigenous, and People of Color (BIPOC) are more likely to reside in a highly vulnerable flood zone due to years of discriminatory housing policy.⁴⁶ Lower income communities are more likely to work jobs with direct exposure to climate hazards (e.g., farmworkers and extreme heat) and suffer greater harm from hazard-driven job disruptions or loss. Put simply, those with the fewest resources to cope with climate change are often the most vulnerable to its impacts.

395
396
397
398
399
400
401
402

Keeping equity at the center of climate adaptation planning is key to ensuring the entire community – not just a small subset – has access to the resources needed to adapt to climate change. More importantly, it means ensuring underserved communities can meaningfully participate in decision-making, planning, and implementation of adaptation strategies. Action at the local level is vital in this regard, as building resilience occurs within a local, site-specific context. Emergency managers, along with elected and appointed officials and other decision-makers, have a responsibility to address climate impacts and the distribution of adaptation benefits by viewing the issue through an equity lens during every step of the planning process.

403
404
405
406
407
408

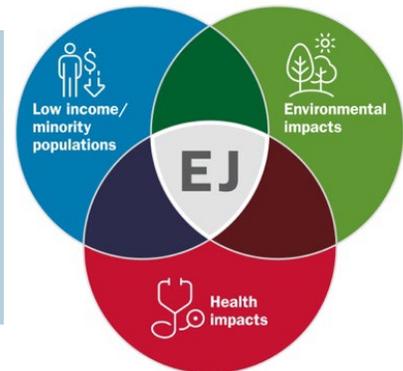

The range of climate-related hazards underscores the complexity of climate change. Climate impacts will affect many aspects of everyday life and may cause people and businesses to relocate. This [relocation process](#) will create both challenges and opportunities for communities, with some areas losing population and others needing to accommodate an influx of new residents.^{47,48} Emergency managers, with their expertise in hazard mitigation and adaptation, can help to improve resilience for a community, and reduce the risk of relocation, through local climate adaptation planning.

409

Environmental Justice

410
411
412
413
414

Environmental justice (EJ) is the fair treatment and meaningful involvement of all people. This goal will be achieved when everyone enjoys 1) The same degree of protection from environmental and health hazards, and 2) Equal access to the decision-making process to have a healthy environment in which to live, learn, and work.⁴⁹

415 2.5. Climate Informed Decision-Making for Emergency Managers

416 Emergency managers routinely influence and make decisions in highly uncertain situations. For
417 instance, emergency managers may be asked to recommend protective actions for a hurricane that
418 has a 70 percent chance of making landfall in their community in the next 72 hours, or for a
419 chemical release with wind conditions that may shift in the next 30 to 90 minutes. In responding to
420 these scenarios, emergency managers seek to minimize the risk, while also arranging for the
421 contingency that conditions may change. As the situation evolves and new information becomes
422 available, emergency managers help leaders adjust risk management actions to cope with the
423 evolving situation.

424 The decision-making approach used in planning and responding to disasters under uncertain
425 conditions is similar to that applied to climate adaptation planning, albeit with a much longer
426 timeline. Rather than operating over a period of hours or days, climate change operates over years,
427 decades, and even centuries. Adaptation plans are often implemented over similar timescales and
428 usually reap rewards (e.g., risk reduction) over longer periods. Yet these plans also need to be
429 revised and updated regularly as new information is gathered (such as updated projections of
430 climate impacts). Climate adaptation planning should recognize that several potential outcomes can
431 occur, especially related to GHG emissions, but also that non-environmental factors will influence the
432 objectives and strategies of the plan.

433 Non-environmental factors that could impact jurisdictional climate adaptation planning include local
434 economic growth and demographic change, urban development patterns, and transportation needs.
435 Outside jurisdictional planning, individuals and businesses themselves may contribute to adaptation,
436 such as an individual installing solar panels or businesses upgrading buildings to increase energy
437 efficiency and more resilient to potential climate change impacts. By taking a broad approach to
438 planning for an uncertain future, emergency managers can help to ensure that climate adaptation
439 plans address a range of potential outcomes.

440 **Emergency Management and Policy Change**

441 Some emergency management policy changes come **AFTER** large disasters, such as after
442 [Hurricane Katrina](#) or [Superstorm Sandy](#).⁵⁰ Yet, local emergency managers may be in a unique
443 position to address policy changes **BEFORE** disasters since they may be working with the [elected](#)
444 [or appointed officials](#) as well as the whole community.⁵¹ A jurisdiction's climate adaptation plan
445 may be used to support future policy changes that consider climate adaptation and resilience.

VI, 120 Stat. 1394 (2006), <https://www.congress.gov/bill/109th-congress/house-bill/5441/text>; FEMA, Sandy Recovery Improvement Act of 2013, Pub. L. No. 113-2, Div. B, 127 Stat. 39 (2013), <https://www.congress.gov/bill/113th-congress/house-bill/152/text>.

⁵¹ FEMA, *Local Elected and Appointed Officials Guide*, https://www.fema.gov/sites/default/files/documents/fema_local-elected-officials-guide_2022.pdf.

446 **2.6. Potential Tools for Climate Modeling**

447 Many tools exist for potential climate modeling needs. [Table 2](#) below provides information on tools
 448 applicability regarding social vulnerability, future conditions and some potential specific hazards.
 449 [Climate Resilience Toolkit](#) also provides an easy website to start filtering for potential climate tools in
 450 relation to specific regions, hazards or the needs of a community.⁵² Using these tools, consistent
 451 with applicable laws, emergency managers can further engage with the public and various planning
 452 partners on potential decision making for climate resilience. For summaries on some of these tools,
 453 see [Appendix B](#) for more information.

454 **Table 2: Climate Resource Capability Inventory⁵³**

Dataset / Application / Tool	Social Vulnerability	Future Conditions	Wildfire	Flood	Hurricane
Climate and Economic Justice Screening Tool (CEJST) - White House	Yes	Yes	No	Yes	No
Coastal Flood Exposure Mapper – NOAA	Yes	Yes	No	Yes	Yes
Community Resilience Estimates - Census Bureau	Yes	No	No	No	No

⁵³ This list is not all-inclusive and represents the most commonly available and used tools for emergency management. Tools listed are often updated without notice. Capabilities identified are as of May 2023 by the FEMA Climate Team.

455 2.7. Communicating Climate Change

456 Communicating climate change, the degree
 457 of uncertainty associated with climate
 458 projections, and information about ongoing
 459 hazard events is a key activity for emergency
 460 managers. They may think of public
 461 information activities primarily in the context
 462 of impending or ongoing disasters and
 463 emergencies. However, risk communications
 464 and public information can also include
 465 efforts to build awareness about how one or
 466 more hazards can affect a community. This
 467 includes communicating climate change for
 468 different contexts, such as ensuring that
 469 future flood risk is considered during the
 470 zoning and building permitting processes for
 471 new developments. More broadly, public
 472 outreach efforts can help community
 473 members understand that certain hazards may become more frequent and severe, and that all
 474 members of the community can adopt a solutions-based approach to these changing conditions.

Scientific Consensus on Climate Change

The U.S.'s foremost scientific agencies and organizations have recognized climate change as a human-caused problem that should be addressed. The [U.S. Global Change Research Program \(USGCRP\)](#) has published a series of scientific reports documenting the causes and impacts of global climate change. [NOAA](#), [NASA](#), and the [EPA](#) have all published reports and fact sheets stating that Earth is warming mainly due to the increase in human-produced heat-trapping gases.

Source: <https://www.climate.gov/news-features/climate-ga/isnt-there-lot-disagreement-among-climate-scientists-about-global-warming>

475 Best Practices for Communicating Climate Change Across Diverse Audiences⁵⁴

- 476 ■ Use terms that resonate with the target audience and find common ground. “Future risk”
 477 and “future conditions” may be good alternative terms to “climate change.”
- 478 ■ Leverage the power of story, [such as through video](#).⁵⁵ Data can be presented when woven
 479 within the context of an engaging story. Without a locally relevant story, focusing too much
 480 on the data may cause people to retreat from the conversation. Stories can make climate
 481 change more relatable.
- 482 ■ Focus on resiliency as well as climate change. Be sure to convey opportunities and a
 483 positive outlook. Get the audience excited about a climate resilient nation and let them
 484 know they have the power to be a changemaker.
- 485 ■ Collaborate with partners who the audience trusts and can carry the message for you.
- 486 ■ Avoid stereotypes. Members of the whole community, of all capacities, capabilities, and
 487 beliefs, are taking action against climate change.

⁵⁴ NOAA, *Isn't there a lot of disagreement among climate scientists about global warming?* <https://www.climate.gov/news-features/climate-ga/isnt-there-lot-disagreement-among-climate-scientists-about-global-warming>.

⁵⁵ Climate stories NC, Click on individual stories at <https://www.youtube.com/@climatestoriesnc6891/videos>.

488 Climate change can be a politically charged topic. Discussions around climate change impacts can
489 produce reactions ranging from denial to [anxiety or depression](#).⁵⁶ Therefore, it is important to ensure
490 that information is based on science and evidence-based research from trusted sources, that
491 statements avoid political agendas, and that discussions emphasize concrete actions to minimize
492 climate change impacts. As stated in the callout box above, emergency managers can avoid political
493 discussions by framing the impacts of climate change as “future risks” or “future conditions.” These
494 terms highlight the frequency and severity of extreme weather events that may increase such as
495 hurricanes, heatwaves, wildfires, droughts, floods, and precipitation.⁵⁷ The goal is to encourage
496 individuals and businesses to actively help decrease climate-related risk exposure.

497 Some public meetings may allow for discussions of longer-lasting, transformational adaptations that
498 can lead to long-term community resilience and sustainability. For example, a discussion could be
499 held on how local land use and zoning processes might mitigate climate change risks and provide
500 additional social, economic and environmental benefits. Alternatively, local meetings might provide
501 opportunities to talk about how infrastructure and building projects could be designed to address
502 climate-related vulnerabilities.

Key Takeaways for Emergency Managers: Climate Science

503

- 504 ▪ The key driver of climate change is the emission of gases that trap heat in the atmosphere,
505 commonly referred to as greenhouse gases (GHG). Since it is not possible to determine
506 exactly what future GHG emissions will be, climate scientists create multiple scenarios
507 based on assumptions often referred to as representative concentration pathways (RCPs).
- 508 ▪ To be prepared for an uncertain future, emergency management planners should consider
509 a broad variety of RCP scenarios and potential cascading disaster impacts on people and
510 the economy in their geographic region. This includes keeping equity at the center of
511 climate adaptation planning efforts as underserved communities are disproportionately
512 impacted by climate change and climate-driven hazards.
- 513 ▪ Emergency managers can use a combination of climate modeling and social vulnerability
514 tools to support planning for and decision making in uncertain future climate conditions.
- 515 ▪ To communicate climate change threats to the public, emergency managers can employ
516 terms such as “future risk” or “future conditions” to show how climate impacts may affect
517 individuals and the whole community.

New Haven, CT: Yale Program on Climate Change Communication (2023).

⁵⁷ NASA, *Vital Signs of the Planet: What’s the Difference Between Climate Change and Global Warming?* [What’s the difference between climate change and global warming?](#).

518 3. Climate Adaptation Planning: An Overview

519 Climate adaptation planning requires planners to think in terms of decades rather than months or
520 years. While there is uncertainty regarding the severity of climate change impacts, there is little
521 doubt that emergency managers can plan for more frequent and more severe climate-driven
522 incidents. Emergency managers will have a leading role in preparing communities for new risks that
523 will be driven by climate change.

524 3.1. Principles of Climate Adaptation Planning

525 Climate adaptation planning starts with understanding the types of climate-related hazards and risks
526 a community will face. This begins with reviewing weather-related disasters that have occurred in the
527 past and then projecting how future climatic conditions may change traditional hazards and create
528 new climate-related risks. Consideration of future climate conditions can be integrated into existing
529 risk analysis and planning activities, such as the Threat and Hazard Identification and Risk
530 Assessment (THIRA), Hazard Identification and Risk Assessment (HIRA), and the development of
531 mitigation and recovery strategies, plans, and exercise materials. Once a community has this
532 information, they can identify how they are likely to be affected by all hazards. Specifically, they can
533 estimate which geographic areas, population groups, community services, and critical infrastructure
534 elements are vulnerable to extreme weather events.

535 In collaboration with a diverse set of community members, planners can then identify strategies and
536 actions for adapting to these new risks. An inclusive, community-wide approach is essential to
537 ensure that both the planning process and the goals, objectives, and strategies are equitable. This
538 means identifying and prioritizing the needs of underserved groups and ensuring equal access to the
539 benefits of adaptation. A climate planning process that is both equity-focused and informed by
540 science will help produce a quality climate adaptation plan. Ultimately, climate adaptation principles
541 should be incorporated into all community planning processes.

542 **Climate and Equity: Portrayal of Underserved Communities**

543 The [United Nations](#) states “Poorer countries and underserved communities, including indigenous
544 peoples who have protected the environment for generations, are often portrayed solely as
545 victims of climate change, rather than positive agents of change. The same is often the case for
546 women and girls. Make sure to highlight the voices, expertise, innovations, positive action, and
547 solutions by people from all walks of life and communities from all parts of the world.”

548 While climate adaptation planning is a heavily technical process due to its reliance on risk data and
549 climate models, it will be most successful when it is people-centered, collaborative, and equitable.
550 This includes building partnerships across the whole community, collectively proposing creative
551 strategies and sharing decision-making to reduce risk from climate change while preserving what the
552 community most values.

553 **3.1.1. FOUR KEY PRINCIPLES**

554 Preparing for climate-related disruptions is a key part of creating climate-resilient communities;
 555 however, climate adaptation planning goes beyond preparedness and disaster response. Adaptation
 556 planning involves implementing policies, management strategies, and long-term investments as part
 557 of a community-wide approach to reduce climate-related risk. Adaptation also uses a long-term
 558 planning horizon (e.g., decades), and plans should be reviewed and updated to include the latest
 559 advancements in climate science. More so, climate adaptation efforts can be shared and
 560 incorporated into all community planning processes and into policies that guide community
 561 development. The following four principles are fundamental to climate adaptation planning:

562 **Focus on the Future:** Even though recent disasters have raised awareness of the impacts
 563 of extreme weather, future climate conditions are likely to be different than what
 564 communities have experienced in the past. Planning for climate resilience involves
 565 planning periods of decades or longer and should factor in how changing climate
 566 conditions might interact with other aspects of a community. These non-environmental
 567 factors include development patterns, population demographics, and emerging
 568 technologies (e.g., new methods of transportation). This inherent uncertainty is an
 569 important aspect of climate adaptation planning. Moreover, focusing on the future
 570 acknowledges the duty that current generations have to take action to ensure a livable
 571 planet for future generations, even if this includes taking hard actions in the short-term.

572 **Link to Community Planning Processes:** Most communities have well-established planning
 573 processes that provide the infrastructure, services, land use, and economic development
 574 foundations for a community to thrive and prosper over time. Effective climate planning
 575 can be integrated into these planning efforts so that strategies are put into place to adapt
 576 such services and infrastructure to withstand future climate-related challenges.

577 **Leverage Partnerships and Relationships:** Just as community planning processes strive to
 578 be transparent and provide opportunities for public and stakeholder engagement, it is
 579 particularly important for outreach and engagement to be part of climate adaptation
 580 planning. Adapting to future climate stresses (e.g., long-term trends that increase
 581 vulnerability) is a relatively new concept, and it is important to ensure community members
 582 and key stakeholders are aware of the threats posed by a changing climate and the ways in
 583 which these impacts could affect different parts of the community. Adaptation planning
 584 provides both a challenge to engage all groups within a community and an opportunity to
 585 establish new relationships and strengthen existing ones.

586 **Use a Multidisciplinary Approach:** Climate adaptation planning involves the integration of
 587 social, environmental, and economic considerations to promote innovative solutions that
 588 are socially acceptable, viable, equitable, sustainable, and increase resilience. Climate
 589 adaptation planning is most effective when it incorporates strategies based in natural
 590 science-, social science-, and engineering-based strategies to increase the communities'
 591 resilience climate-related as well as other types of disruptions. Examples include:

A field undergoing wetland restoration

Natural sciences help in understanding the risks caused by climate change, particularly those important to habitat and biodiversity. This information can be used to mitigate impacts on wildlife, such as fisheries. Nature-based solutions (NBS) can also increase resilience through the integration of natural features into the built environment, helping to reduce flood risk, lower urban heat, and more. Examples include [wetland restoration](#), [permeable pavement](#), [green roofs](#), and [living shorelines](#).⁵⁸

Helping an elderly neighbor after Hurricane Harvey (2017)

Social sciences provide important context for understanding and responding to the public health, economic, and equity impacts of climate change. Social sciences can provide information about the impacts that climate change will have on people and encourage sustainable practices that best fit the needs and culture of the community.

Combining solar panels with a green roof

Engineering offers effective and innovative strategies for adapting to the impacts of climate change and the possibility of novel approaches in the future. For example, there are opportunities to integrate the engineering of stormwater infrastructure (e.g., flood levees, drainage systems, rainwater retention measures) and natural systems into a mutually reinforcing and cost-effective approach for environmental management.⁵⁹ These approaches can also benefit climate mitigation, such as by reducing building energy use.

619 Many communities also undertake [pre-disaster recovery planning](#)⁶⁰ that establishes strategies to
620 lessen disruptions following a disaster. These recovery strategies can be a useful foundation for
621 climate resilience in traditional planning. Aligning strategies and leveraging funding opportunities
622 can also contribute to a cohesive community climate adaptation strategy.

⁵⁸ For more information on NBS, see <https://www.fema.gov/emergency-managers/risk-management/nature-based-solutions>.

⁵⁹ NOAA, *Engineering With Nature: USACE, NOAA, and the Value of Partnership*. [Engineering with Nature: USACE, NOAA, and the Value of Partnership - Podcast: Episode 55](#).

623 **3.2. Emergency Management Funding and Adaptation Solutions for**
624 **Climate Change**

625 An important question to ask is: “Are established planning processes flexible enough to consider
626 adaptation and associated equity concerns, or do the processes need to change?” If processes need
627 change, leveraging funding opportunities through emergency management may provide potential
628 solutions.

629 **Before Disasters: Emergency managers work with—and invest funds in—communities to build a**
630 **nation able to withstand the climate hazards of today and those we can anticipate for tomorrow.**

- 631 ▪ FEMA programs like the [Building Resilient Infrastructure and Communities](#) (BRIC) and the [Flood](#)
632 [Mitigation Assistance](#) (FMA) grant programs provide resources so communities are better
633 prepared before disasters or extreme weather events strike.⁶¹
- 634 ▪ The [National Exercise Program](#) provides support to federal and SLTT government partners to
635 assess and enhance response and recovery capacities.⁶²
- 636 ▪ [FEMA grants](#) allow for investment in the infrastructure, including NBS and adoption of hazard-
637 resistant [building codes](#), and response and recovery capabilities.⁶³

638
639 **After Disasters: Emergency managers provide information and funding to help SLTT officials**
640 **strategically invest in building back to increase climate resilience.**

- 641 ▪ FEMA’s [Hazard Mitigation Grant Program](#), including 406 Public Assistance Grants and [Post-Fire](#)
642 assistance, goes beyond just rebuilding; these grants fund efforts for building back stronger and
643 more resilient to future threats.⁶⁴
- 644 ▪ The Inflation Reduction Act (IRA) enables FEMA to fund costs associated with low-carbon
645 materials to help cut carbon pollution (GHGs) to support climate resilience in communities.⁶⁵

⁶¹ For more information on BRIC and FMA, see <https://www.fema.gov/grants/mitigation/building-resilient-infrastructure-communities> and <https://www.fema.gov/grants/mitigation/floods>.

⁶² For more information on the National Exercise Program, see <https://www.fema.gov/emergency-managers/national-preparedness/exercises/about>.

⁶³ For more information on FEMA grants and Building Codes, see <https://www.fema.gov/grants> and see <https://www.fema.gov/emergency-managers/risk-management/building-science/building-codes-strategy>.

⁶⁴ For more information on FEMA’s Hazard Mitigation Grant Program and Post Fire Program, see <https://www.fema.gov/grants/mitigation/hazard-mitigation> and <https://www.fema.gov/grants/mitigation/post-fire>.

Resources Available to Support Communities

646

647

648

649

[FEMA Resources for Climate Resilience](#) provides a comprehensive explanation of FEMA programs planning for climate change.⁶⁶ Furthermore, [Appendix C](#) highlights other potential federal, state, local, private, and philanthropic funding sources.

650

651

652

653

654

655

Climate adaptation strategies often have short- and long-term benefits beyond enhancing community resilience. For example, using NBS to expand the flood water-carrying capacity of lands adjacent to a river could provide recreational, aesthetic, biodiversity, and quality of life benefits to a community (see [Figure 7](#)). Benefits for other types of strategies might be linked to economic development, public health, air and water quality, and improved housing. In some situations, climate adaptation strategies could also contribute to reductions in GHG emissions.

656

657

658

659

660

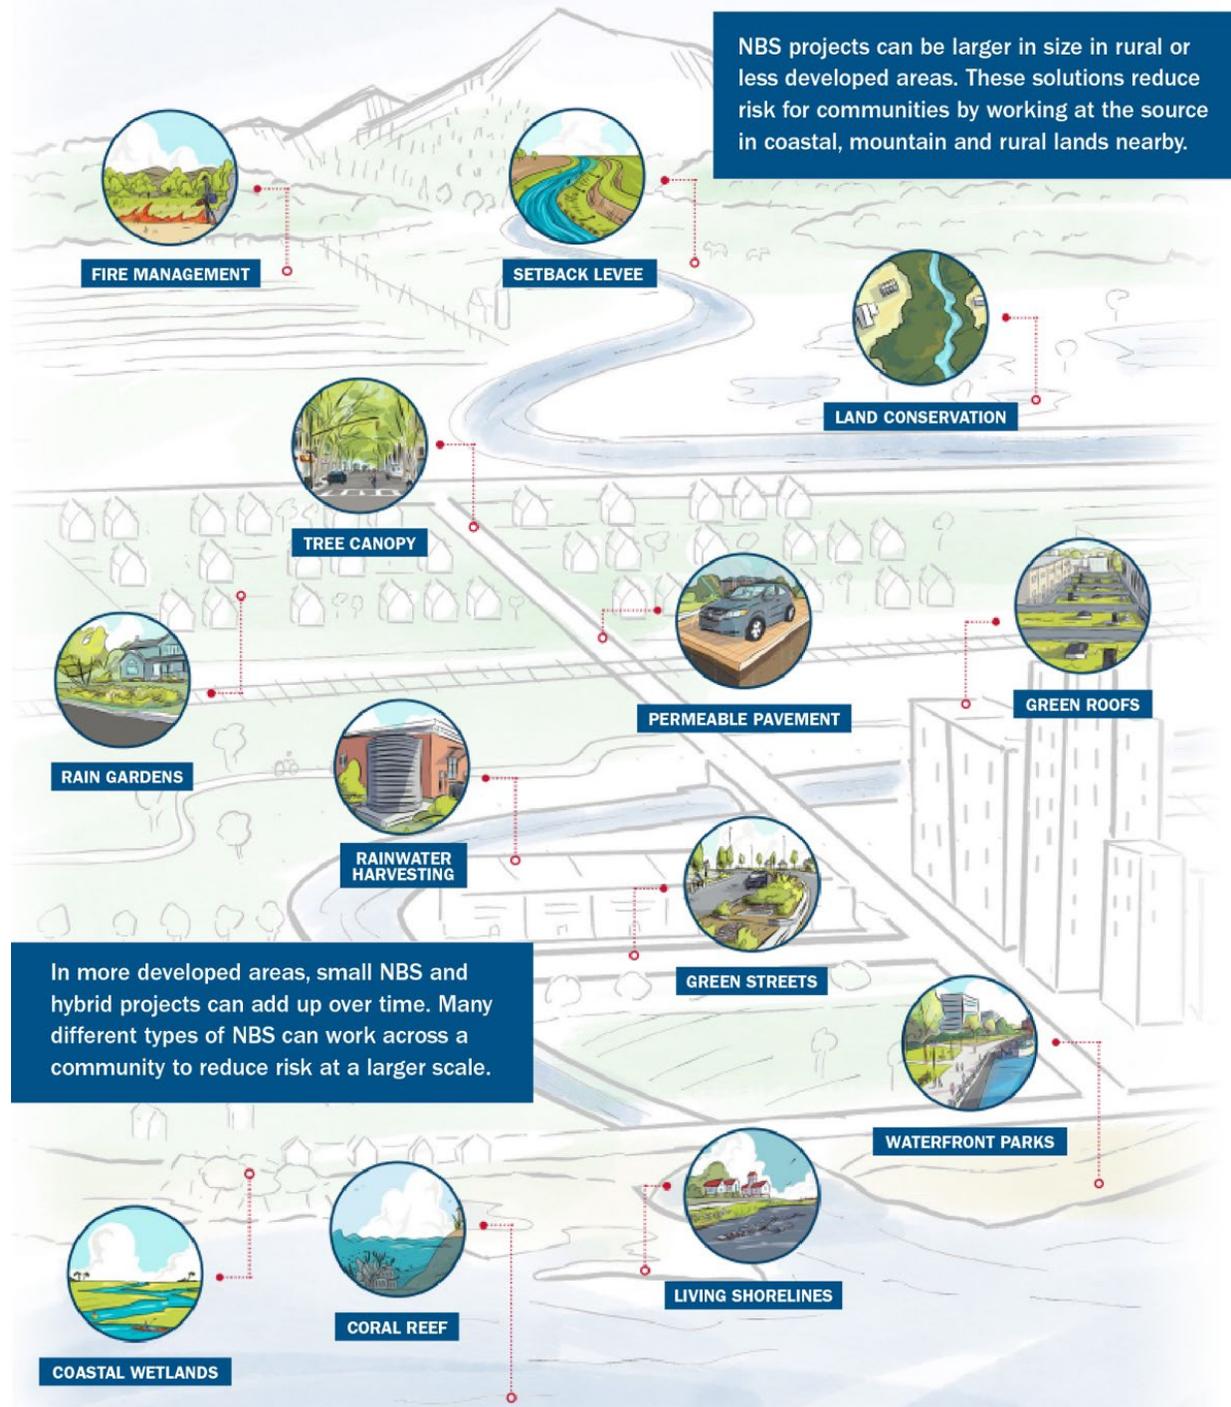

661

Incorporating climate resilience principles throughout community planning can help reduce the likelihood of engaging in maladaptation. Examples of maladaptation include building seawalls that then shift vulnerability to people elsewhere or eliminating floodplains, which in turn reduces the nutrients in soils previously provided by flood water.⁶⁷ Officials who are often tasked with budgeting for community services and capital investments should incorporate climate-related risk and sustainability considerations into their decision-making processes.

662

⁶⁶ For more information on FEMA's Resources for Climate Resilience, see https://www.fema.gov/sites/default/files/documents/fema_resources-climate-resilience.pdf.

⁶⁷ Schipper, Lisa, *Maladaptation: When Adaptation to Climate Change Goes Very Wrong*. One Earth (2020). <https://pubag.nal.usda.gov/catalog/7171690>.

663

664

Figure 7: Nature-Based Solutions (NBS) Across Landscapes⁶⁸

⁶⁸ For more information on Building Community Resilience with Nature-Based Solutions, see https://www.fema.gov/sites/default/files/documents/fema_nature-based-solutions-guide-2-strategies-success_2023.pdf.

665 **Types of Adaptation**

666 ▪ **Low-Regrets:** Low-regrets actions are cost-effective now and under a range of future climate
667 scenarios and do not involve hard trade-offs with other policy objectives. These actions are
668 relatively low cost and provide relatively large benefits under predicted future climates. They
669 contribute to adaptation while also having other social, economic, and environmental policy
670 benefits, including benefits related to mitigation. Examples include efforts to improve water
671 efficiency and/or building energy efficiency; preserving landscapes in support of biodiversity;
672 and land use planning to minimize flood hazard exposure.

673 ▪ **Incremental:** This adaptation pathway involves discrete actions that minimize present-day
674 climate impacts. Typically, these actions follow a climate-related disruption and target
675 solutions to a specific event or vulnerability. Examples include increasing
676 stormwater/wastewater capacity; building flood protection; designing buildings to meet
677 future climate demands; and increasing water reservoirs.

678 ▪ **Transformational:** Transformative adaptation involves large-scale changes that contribute to
679 long-term societal resilience and sustainability. This can emerge from both individual and
680 collective action and takes a long-term perspective while recognizing diverse constituent
681 interests. Transformational adaptation may involve institutional reform, structural changes,
682 and coordination across multiple levels of governance. Examples include funding the
683 relocation of underserved communities; changing land use patterns to restrict use in high-
684 risk areas (e.g., wildland fires, flood prone areas); and prioritize protecting ecosystems.

685 ▪ **Maladaptation:** Maladaptive responses to climate-driven events are those that end up
686 increasing vulnerability and reducing community resilience. Such actions may address short-
687 term risks but in the long run increases disaster exposure. Examples include building
688 seawalls in highly vulnerable areas; planting trees in wildfire-prone areas; investing in
689 protection for valuable assets; and neglecting underserved communities.

690 Climate adaptation strategies are also often more effective when implemented across many different
691 communities without pushing the impacts into other jurisdictions. Regional coordination can lead to:

- 692 ▪ Consensus on which future climate scenarios should be used in vulnerability analyses;
- 693 ▪ Identifying the types of mitigation and adaptation strategies that would be most cost effective;
- 694 ▪ Sharing of data, tools, and other resources for climate as well as response and recovery
695 operations; and
- 696 ▪ Identifying the types of mitigation and adaptation strategies that require collaboration across the
697 region's communities to reach their full benefits.

698

Case Study: Southeast Florida Regional Climate Change Compact

699

The Southeast Florida Regional Climate Change Compact⁶⁹ began in 2009 when local officials in Broward, Miami-Dade, Monroe, and Palm Beach counties met to discuss how they could “work collaboratively to reduce regional GHG emissions, implement adaptation strategies, and build climate resilience within their own communities and across the Southeast Florida region.” The Compact has three major objectives:

704

- Share regional tools and knowledge, including developing new analysis tools and standards, with an aim of enhancing local government capacity to implement regional climate solutions.

705

706

707

- Increase public support and political will by providing nonpartisan credibility, legitimacy and continuity necessary for meaningful government action.

708

709

- Coordinate action in accelerating the pace and impact of efforts to increase the region’s climate resilience.

710

711

The Compact has created bipartisan support for climate action, developed new partnerships with key stakeholders, and created a vision for regional strategies for addressing climate change risks.

712

713

714

Key Takeaways for Emergency Managers: Climate Adaptation Planning

715

- Consider integrating future climate conditions into existing risk analysis and planning activities, such as the THIRA, HIRA, and the development of mitigation and recovery strategies, plans, and exercise materials.

716

717

718

- Climate adaptation planning is most effective when it incorporates strategies based in natural science-, social science-, and engineering-based strategies such as NBS.

719

720

- Leverage diverse funding opportunities (emergency management grants, other government funds, or public and private sources) and work across different communities and jurisdictions to be most effective.

721

722

723

⁶⁹ Southeast Florida Regional Climate Change Compact, *What is the Compact?* (2022), <https://southeastfloridaclimatecompact.org/about-us/what-is-the-compact/>.

724 4. Climate Adaptation Planning: Six Step Planning 725 Process

726 This section provides a step-by-step process for integrating climate adaptation principles into
727 emergency management planning. While this section presents the planning process from the
728 perspective of developing a stand-alone plan, the process and its outputs can also be used to
729 incorporate adaptation concerns into other community plans such as:

- 730 ▪ Hazard mitigation plans (comprehensive and specialized examples such as flood control plans);
- 731 ▪ Emergency operations plans (EOPs) and appendices;
- 732 ▪ Recovery plans and strategies;
- 733 ▪ Local comprehensive and land use plans;
- 734 ▪ Economic development plans;
- 735 ▪ Transportation and capital improvement plans;
- 736 ▪ Sustainability and climate action plans;
- 737 ▪ Community health assessments and community health improvement plans; and
- 738 ▪ Water and land management plans.

739 This section builds upon the scientific and analytical approaches addressed in [Section 2](#). It also
740 proposes guidance on the integration of climate-related risks and adaptation principles into a
741 community’s broader planning processes and institutional structure.

742 U.S. Climate Resilience Toolkit

743 The [U.S. Climate Resilience Toolkit](#)⁷⁰ has a user-
744 friendly Practitioner’s Guide for Implementing
745 Steps to Resilience.⁷¹ While there are some
746 differences between the Toolkit’s Steps to
747 Resilience ([Figure 8](#) at right) and this FEMA guide,
748 which is specific for emergency managers, the
749 fundamental approach and actions are similar.
750 This guide aligns the key climate adaptation
751 planning actions included in the in the U.S.
752 Climate Resilience Toolkit to the six-step planning
753 process outlined in FEMA’s CPG 101, as shown in
754 [Figure 9](#) on next page.

Figure 8: U.S. Climate Resilience Toolkit’s Steps to Resilience

⁷⁰ NOAA, *U.S. Climate Resilience Toolkit* (2014). <http://toolkit.climate.gov>.

⁷¹ For more information on the Practitioner’s Guide for Implementing Steps to Resilience, see <https://toolkit.climate.gov/content/practitioners-guidance-implementing-steps-resilience>.

755

756

Figure 9: Steps in the Planning Process

757 Traditional emergency planning and climate adaptation planning share many similarities; however,
758 there are a few differences:

- 759 ▪ **Climate adaptation planning has a higher degree of uncertainty and should consider multiple**
760 **future climate scenarios.** Traditional emergency planning often relies largely on historical data.
761 However, climate change necessitates a shift to focusing primarily on future climate scenarios.
762 As it is not possible to know what future emissions levels and climate mitigation policies will be,
763 adaptation planning should consider multiple climate scenarios (e.g., intermediate emissions,
764 high emissions) and recognize that some impacts may be difficult to predict.
- 765 ▪ **Climate adaptation planning is an iterative process.** It cannot be completed once and then set
766 aside for 15 years. Knowledge of climate science and climate-related vulnerabilities is constantly
767 evolving. Likewise, community factors such as demographics and key institutions change over
768 time. Therefore, climate adaptation plans need to be monitored and adjusted regularly to ensure
769 adaptation strategies are effective.
- 770 ▪ **Climate adaptation planning should be a key part of all community planning.** While stand-alone
771 climate adaptation plans are important, climate adaptation planning and strategies should be
772 woven into all emergency and community planning efforts. For example, a decentralized energy
773 system using solar power can be taken down before big storms and then reinstalled after to
774 reduce potential loss of power.

775 Despite its differences, climate adaptation planning should take advantage of relevant existing
776 planning. All 50 states, the District of Columbia, and U.S. territories have FEMA-approved hazard
777 mitigation plans, as do more than 24,700 local and 224 tribal governments.⁷² These plans and the
778 information developed for them can provide a useful launching point for climate adaptation planning.

⁷² At the time of publication.

779 *Emergency managers' experience in hazard mitigation planning is an opportunity to assume a*
780 *leadership or coordinator role in climate adaptation planning. [Updated hazard mitigation planning](#)*
781 *[policies](#) reinforces resilience as a whole community effort. State, tribal and local hazard mitigation*
782 *plans must now address current and future risks, including those from climate change, land use and*
783 *population change. The policies support mitigation planning's integration with other complementary*
784 *community actions, such as climate adaptation, resilience and sustainability planning initiatives.*
785 *These efforts build state and local capabilities and help jurisdictions plan for long-term risk*
786 *reduction, climate change and more-equitable outcomes.⁷³*

787 **CPG 101 Planning Principles Critical to Climate Adaptation Planning**

788 Planning should:

- 789 ▪ Be community-based, representing the whole population and its needs.
- 790 ▪ Emphasize caring for people with disabilities and individuals with access and functional
791 needs, infants, children, and older adults.
- 792 ▪ Include all stakeholders in the community.
- 793 ▪ Address equity in all phases of the planning process. This includes prioritizing the needs of
794 underserved communities and ensuring no population is disproportionately impacted by
795 decisions.
- 796 ▪ Engage the private sector.
- 797 ▪ Have elected and appointed officials invest political will throughout the process.
- 798 ▪ Consider all hazards and threats.
- 799 ▪ Recognize that time, uncertainty, risk, and experience influence planning.
- 800 ▪ Inform those with agency responsibilities what to do and why.

801 The following sections walk through each step of the planning process, highlighting the key actions
802 for climate adaptation planning.

803 **4.1. Step 1: Form a Collaborative Planning Team**

804 The first step of the planning process is to form a collaborative planning team. This begins with
805 identifying the core planning team members who are responsible for the bulk of the analysis and

⁷³ For more information on Hazard Mitigation Planning Policy updates, see <https://www.fema.gov/emergency-managers/risk-management/hazard-mitigation-planning>.

806 planning activities. Efforts are then expanded to identify the broader collaborative planning team
807 members and processes to ensure whole-community engagement.

808 Climate adaptation planning touches on all aspects of community life and requires the engagement
809 of a broad range of stakeholders. Emergency managers have expertise in areas that are essential to
810 adaptation planning, such as hazard identification and risk management. They also have knowledge
811 of community resources and local characteristics. Depending on the jurisdiction, the emergency
812 manager may serve in a coordinating role for the planning effort.

813 **Climate and Equity: Environmental Justice (EJ) Based Decision Making**

814 Emergency managers can make more equitable EJ-based decisions by targeting resources and
815 grants to the underserved and integrating EJ into communications and directives. Emergency
816 managers can also collaborate with historically underserved communities to ensure their
817 perspectives and knowledge are included in climate adaptation planning and decision making.

818 Climate adaptation planning is most successful when people with skills and expertise in many areas
819 are part of the effort. The specific expertise needed for the planning team will depend on the
820 geographic scope of the planning effort, the characteristics of the jurisdiction, and the scope of
821 activities. Examples of expertise that may be needed on the planning team include climate science,
822 engineering (e.g., structures, transportation, water resources), community planning, public
823 engagement strategies, social impact assessment, economic development, and finance. The core
824 planning team may also establish advisory committees (e.g., technical, public) to assist on issues
825 such as the preservation of historic resources or to ensure the interests of underserved and
826 marginalized communities are heard with meaningful engagement.

827 During this initial step of the planning process, the planning team may also find it helpful to discuss
828 and document some preliminary planning goals and considerations to help guide the effort.

829 **Questions to Consider When Forming the Collaborative Planning Team**

- 830 ▪ How does the jurisdiction define a climate-resilient community?
- 831 ▪ What does success look like for this effort and what are possible barriers or challenges to
832 achieving this success? What is the target timeframe for developing the plan?
- 833 ▪ How can the planning team take advantage of existing planning and preparedness
834 activities (such as hazard mitigation planning and community preparedness efforts) to
835 inform the planning effort?
- 836 ▪ What types of education, outreach, and advisory structures should be established to
837 encourage awareness and participation in the planning effort?
- 838 ▪ How will the products of this effort be used to inform community/governmental decision-
839 making?

Key Takeaways for Emergency Managers: Step 1

840

841

- Lead or participate in scoping efforts to identify preliminary goals and considerations.

842

- Identify key participants in hazard mitigation and community preparedness planning who could participate in climate adaptation planning.

843

844

- Describe funding opportunities for mitigation, community preparedness, and adaptation strategies, programs, and projects.

845

846

- Advocate for broad representation on the planning team to include individuals with disabilities and others with access and functional needs as well as those that have been historically underserved.

847

848

849

4.2. Step 2: Understand the Situation

850

The second step of the planning process focuses on developing a solid understanding of the community and its needs, resources, and risks. This information will inform the identification of goals and objectives in [Step 3](#) and identification of adaptation strategies in [Step 4](#). After forming the collaborative planning team, this second step is important in identifying common language to use prior to prioritizing goals and objectives. While this step focuses on identifying the community's climate-related risks, it is also important to document key community characteristics and needs.

851

852

853

854

855

Questions to Consider When Examining Risk and Vulnerability

856

857

- What are the demographics of the community?

858

- What populations have been historically underserved and what challenges do they face?

859

- What infrastructure, facilities, assets, community services, and cultural or historical features are important to the community and need to be protected?

860

861

- What other voices are needed in this planning process?

862

Regarding the community's climate-related risks, there are two key actions: 1) collecting and evaluating data and information on historical and projected climate conditions, along with the resulting threats and hazards, and 2) assessing current and future levels of risk to the community's people, assets, infrastructure, and services.

863

864

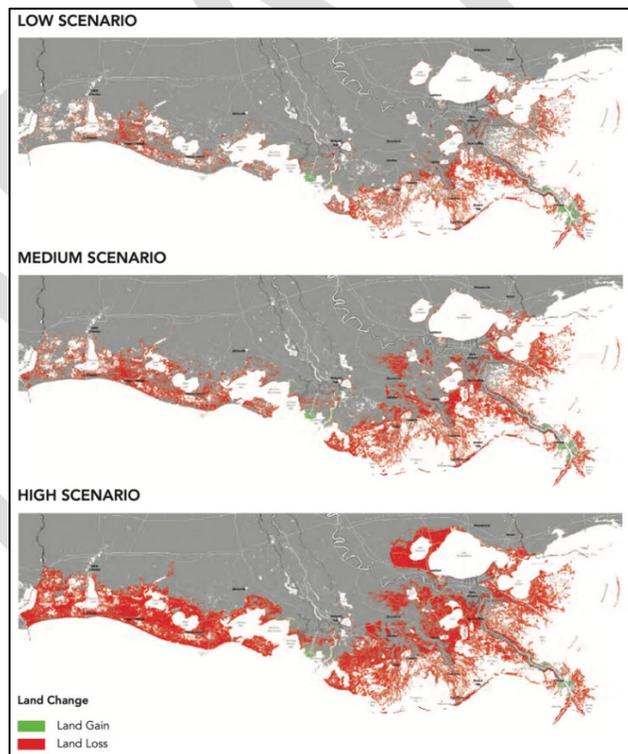

865

866 **Evaluate Historical and Future Climate Conditions**

867 Identifying and understanding past extreme weather-related events is an important starting point.
868 Many of these hazards are likely already identified in the community’s hazard mitigation plan. This
869 historical data provides a useful backdrop for evaluating how climate change will amplify current
870 hazards, as well as potentially create new ones; however, it is not sufficient to rely on historical data
871 alone. Planners should be familiar with widely used climate projections and understand how they
872 may impact local conditions.

873 The selection of which RCP scenario(s) to use in climate adaptation planning is a critical decision.
874 Jurisdictions may choose to select:

- 875 1) A single scenario—for example, the most likely future condition or the worst-case scenario.
- 876 2) Multiple scenarios—such as a low scenario, medium and high-case scenario—to establish a range
877 of possible outcomes. For example, Louisiana’s 2017 coastal master plan used three climate
878 scenarios to project future land changes (land lost in red or gained in green) over the next 50 years
879 (see [Figure 10](#)). Using multiple scenarios best captures future climate uncertainties.

880

881 **Figure 10: Example of Climate Scenarios Used in Louisiana’s Coastal Master Plan⁷⁴**

⁷⁴ Coastal Protection and Restoration Authority of Louisiana, *Louisiana’s Comprehensive Master Plan for a Sustainable Coast* (2018). http://coastal.la.gov/wp-content/uploads/2017/04/2017-Coastal-Master-Plan_Web-Book_CFinal-with-Effective-Date-06092017.pdf.

882 The plan should also communicate the uncertainties associated with the key variables being used to
883 create plan objectives and strategies. For example, coastal communities that need to plan for sea
884 level rise should consider and communicate the difficulty of modeling rapid ice cap melting, which
885 makes projecting the upper bounds of sea level rise difficult.⁷⁵

886 Once the planning team has selected a climate scenario(s), they can use climate modeling
887 resources, such as those covered in [Section 2.6](#), to evaluate predicted future impacts. Comparing
888 these impacts to historical data (e.g., historical heat wave, flood levels) will enable the planning team
889 to estimate the type and severity of future climate impacts.

890 **Assess Vulnerability and Risk to Community Assets and Services**

891 Once the planning team has predicted the types and severity of future hazards, they can conduct a
892 risk assessment. The risk assessment examines how vulnerable the community, or a particular
893 facility, asset, service, or population is to the impacts of predicted climate hazards. Risk
894 assessments are the basis for determining which adaptation strategies will provide the greatest risk
895 avoidance and reduction.

896 In some cases, risk can be determined with a relatively high level of accuracy. For example, with
897 projected flooding impacts to infrastructure, a simple engineering analysis can determine if a
898 highway, bridge, building, electrical grid component, or element of the telecommunications
899 infrastructure will be compromised and possibly damaged. The planning team can then use this
900 information to estimate the level of damage that might occur and thus the costs of replacing or fixing
901 the damaged components. However, for other types of vulnerabilities, such as with human
902 populations, it is more difficult to quantify damage or loss, including the loss of life.⁷⁶ For example,
903 people displaced from their homes due to floods or extreme temperatures may also face emotional,
904 psychological, physical, and social stress due to the disruption to their lives.

905 Risk assessments need to account for the probability or likelihood of these events occurring and the
906 likelihood of damage. The costs associated with damage or loss to the facility or asset are often
907 factored in as well. Yet, risk analysis differs under climate change because the environment is not
908 static, meaning that the risk of an event occurring will shift over time. For example, what has
909 historically been a 1 percent flood event (1-in-100 years) may now be a 1.25 percent flood event (1-
910 in-80 years), given recent climate changes. The same event might have a 2 percent (1-in-50 years)
911 probability of occurrence by 2050 and a 5 percent (1-in-20 years) probability of occurrence by 2100.

912 Similarly, the amount of damage or loss from an event may change over time as the impacts become
913 more severe under climate change (e.g., higher floodwaters). The use of emission scenarios is one
914 way of capturing a range of possible values for key climate conditions, such as temperatures and

⁷⁵ USGCRP, *Fourth National Climate Assessment: Volume II: Impacts, Risks, and Adaptation in the United States* (2018).
<https://nca2018.globalchange.gov/chapter/2/>.

⁷⁶ For more information on the value of statistical life, see <https://hazards.fema.gov/nri/data-glossary#VSL> or
<https://www.epa.gov/environmental-economics/mortality-risk-valuation>.

915 precipitation. The scenarios then enable
916 planners to evaluate how different amounts
917 of change impact risk outcomes.

918 Lastly, planners must consider the cost due
919 to damage or loss, which is more than simply
920 the replacement or repair cost. It often
921 includes the societal costs of losing the
922 functionality of the asset or facility. For
923 example, a damaged bridge will have costs
924 associated with repair or replacement, but
925 there will also be costs to those having to find
926 other paths to their destinations (e.g., detour
927 time) and to those who now have more
928 limited options for moving people and goods.

929 In evaluating risk, it is important to:

- 930 ▪ **Consider the vulnerability of different populations** to the predicted hazard(s) and the populations'
931 ability to adapt to the impacts (e.g., adaptive capacity). In adaptation planning, most effort is
932 spent on identifying the level of exposure to different climate hazards. For example, the extent of
933 future flooding given a climate scenario indicates the populations, facilities and structures, and
934 other community resources that will be exposed to this hazard. How disruptive this hazard is to
935 individuals and groups is driven by underlying social, economic, demographic, and physical
936 factors.⁷⁷ While not a dedicated part of risk analysis, considering vulnerability and associated
937 equity impacts is critical for this stage of the planning process.
- 938 ▪ **Identify and focus on critical community facilities, assets, and services.** FEMA's concept of
939 Community Lifelines⁷⁸, the most fundamental services in the community that, when stabilized,
940 enable all other aspects of society to function, is useful in identifying key infrastructure and
941 assets (for more on the cascading climate impacts to Community Lifelines, see [Appendix A](#)).
942 Other institutions, including historical buildings, social or religious institutions, and unique
943 community features (e.g., monument, county park), may be identified as priorities for investment
944 or protection. Planners may consider the cascading impacts of potentially losing those services in
945 the prioritization process and they should note that economic valuation may be insufficient to
946 capture community concerns.
- 947 ▪ **Identify geographic areas in the community that are at high risk to climate threats.** Focus on
948 assets that could be particularly vulnerable to climate-related hazards and risks, so they can be
949 documented in the plan and factored into the adaptation actions. FEMA's description of assets
950 of concern for local hazard mitigation planning is a good starting point for identifying those that

FEMA's Job Aid "[Increasing Resilience using THIRA/SPR and Mitigation Planning](#)"

describes the similarities and differences between hazard mitigation planning and the THIRA/Stakeholder Preparedness Review (SPR) process and provides an overview of an optional approach to streamline state, territory, and tribal submissions of the hazard mitigation plan and the THIRA/SPR. This optional approach may reduce duplication and maximize efficient use of these processes.

Source: https://www.fema.gov/sites/default/files/2020-09/fema_thira-hmp_jobaid.pdf

⁷⁷ FEMA, 2022. Op cit.

⁷⁸ For more information on Community Lifelines, see <https://www.fema.gov/emergency-managers/practitioners/lifelines>.

951 should be part of the adaptation planning process. As noted in the [Local Mitigation Planning](#)
952 [Policy Guide](#),⁷⁹

953 *“Assets are determined by the community and include, but are not limited to 1)*
954 *people (including underserved communities and socially underserved*
955 *populations). 2) structures (including facilities, lifelines and critical infrastructure).*
956 *3) systems (including networks and capabilities). 4) natural, historic, and cultural*
957 *resources and 5) activities that have value to the community.”*

958 An important component of this definition is the phrase “determined by the community.”
959 Infrastructure networks, for example, already have criteria that indicate their importance (e.g., level
960 of demand, provision of access to other important community activities). Experience with adaptation
961 planning has shown that community residents can often provide important insights on which
962 facilities and services are critical to their everyday activities. Examples of essential community
963 facilities include hospitals and other medical facilities, police and fire stations, emergency operations
964 centers, evacuation shelters, resilience hubs, cooling centers, cultural centers, and schools.
965 Transportation, water, wastewater, telecommunication, and power grid networks are good examples
966 of critical infrastructure networks.

967 In a real-world example, the following callout box describes the prioritized threats and risks the
968 Jamestown S’Klallam Tribe (WA) identified in their climate adaptation plan. Note that while impacts
969 to critical infrastructure are included, the community placed a higher priority on climate-related risks
970 to cultural, spiritual, socioeconomic, and nutritional health.

971  **Case Study: Jamestown S’Klallam Tribe (WA) Climate Change Risks**

972 Excerpts from the [Jamestown S’Klallam Tribe’s \(WA\) climate adaptation plan](#).⁸⁰

- 973 ■ Higher average temperatures will generate more extreme heat events and increased heat
974 stress for plants, animals, infrastructure, and humans.
- 975 ■ Water usage from the Dungeness River is already considered critical due to multiple
976 competing uses, especially during low flow conditions in the late summer and early fall.
977 Shifting seasonal precipitation will lead to wetter winters and drier summers; winter
978 snowpack has decreased, and spring snowmelt occurs earlier, increasing spring flows and
979 decreasing summer and fall flows.
- 980 ■ Rising sea levels will increase coastal flood risk.

⁷⁹ FEMA, *Local Mitigation Planning Policy Guide* (2023). https://www.fema.gov/sites/default/files/documents/fema_local-mitigation-planning-policy-guide_042022.pdf

⁸⁰ Jamestown S’Klallam Tribe, *Climate Vulnerability Assessment and Adaptation Plan*. *Adaptation International* (2013). https://jamestowntribe.org/wp-content/uploads/2018/09/3-JSK_Climate_Change_Adaptation_Report_Final_Aug_2013s.pdf

- 981 ▪ Higher acidic ocean waters will make it more difficult for some organisms to build their
- 982 shells, potentially affecting their survivability and the abundance of predator species, such
- 983 as salmon.
- 984 ▪ The Northwestern portion of the Olympic Peninsula is projected to become drier, shifting
- 985 tree species away from primarily western hemlock to primarily Douglas fir and causing
- 986 coincident declines in western red cedar.
- 987 ▪ Climate change impacts human health directly (e.g., storm events) and indirectly through
- 988 intermediate environmental factors (e.g., air pollution).
- 989 ▪ Population-wide changes to tribally valued plants and animals have the potential to disrupt
- 990 cultural, spiritual, socioeconomic, and nutritional health.
- 991 ▪ Through a community-driven process, tribal members identified the following as the priority
- 992 areas of concern relating to climate change:

Very High Priority

- Salmon, clams, and oysters
- Shellfish biotoxins
- Wildfires
- Cedar harvests

High Priority

- Casino and Longhouse market
- State Highway 101
- Tribal campus water supply infrastructure

Medium Priority

- Jamestown Beach water supply infrastructure
- Laboratory and Planning Department buildings
- Tribal wastewater infrastructure

993

Key Takeaways for Emergency Managers: Step 2

- 995 ▪ Identify data and information sources on past extreme weather-related events.
- 996 ▪ Lead or participate in the process of:
 - 997 - Understanding past extreme weather events and their impacts to the community,
 - 998 Community Lifelines, and identify lessons for the future.
 - 999 - Identifying and evaluating climate scenarios and the types of impacts and consequences
 - 1000 these conditions may have on the community.
 - 1001 - Identifying underserved population groups, as well as critical community facilities,
 - 1002 assets, and services that could be affected by changing climatic conditions.
- 1003 ▪ Collaborate with others to provide information and outreach to the community so different
- 1004 groups understand the potential risks posed by climate-related hazards.

1005 **4.3. Step 3: Determine Goals and Objectives**

1006 The next step in the planning process focuses on using the information gathered during [Step 2](#) to
 1007 develop goals, objectives, and performance metrics for the climate adaptation plan. These are then
 1008 used to guide the identification of the adaptation strategies and actions that the jurisdiction will
 1009 choose to undertake during [Step 4](#) of the process.

1010 **Set Goals and Objectives**

1011 Goals and objectives describe the desired outcomes of the effort and inform the steps needed to
 1012 achieve them. The process of setting goals and objectives for climate adaptation planning is similar
 1013 to the process used for general and emergency planning. Given that climate adaptation planning can
 1014 incorporate a broad array of objectives over long timeframes, it is important to ensure that each
 1015 stated objective is targeted and actionable. Equally important, the process of setting goals and
 1016 objectives should incorporate a wide range of community partners, including both individuals and
 1017 organizations, to ensure a high level of buy-in with the plan and investment in its implementation.

1018 **Examples of Goals and Objectives Include:**

1019 **Goal:** Reduce the exposure or sensitivity (degree to which exposure impacts the system) of
 1020 critical structures, infrastructure, populations, and habitats to climate change risks.

1021 **Objective:** Reduce the number of households exposed to floods with a 1 percent annual
 1022 chance of occurrence – at mid-century – by at least 50 percent.

1023 **Objective:** Require the adoption of energy efficient home cooling technology and design
 1024 features in all newly built residential housing and encourage their adoption in existing
 1025 housing units.

1026 **Objective:** Partner with civic centers and other key community institutions to develop
 1027 hazard response networks (e.g., planned check-ins with underserved households during a
 1028 heat wave, establishment of accessible cooling and warming stations).

1029 **Goal:** Reduce the sensitivity of stormwater infrastructure to extreme rainfall events.

1030 **Objective:** Make community-wide infrastructural investments and operational changes so
 1031 the community can cope with rainfall events that are 40 percent larger than the historical
 1032 annual maximum event by mid-century.

1033 **Objective:** Encourage the adoption of green (e.g., bioswales) or gray (e.g., water reuse)
 1034 stormwater/wastewater infrastructure by individual landowners.

1035 To ensure the goals and objectives help create a more resilient community with greater adaptive
 1036 capacity, it is important to develop metrics that can be used to evaluate progress. Metrics fall into
 1037 two categories: *process* measures and *outcome* measures. See [Table 3](#) for a comparison of these
 1038 measures.

1039 **Table 3: Process Measures versus Outcome Measures**

Process Measures	Outcome Measures
<ul style="list-style-type: none"> ▪ Process measures assess adaptation efforts or operations, as well as the allocation of resources. ▪ Examples include the number of staff trained in resilience procedures, the number of systems (e.g., communication, data management, disaster response) updated for greater resilience, the level of planning coordination across agencies or governments, etc.⁸¹ 	<ul style="list-style-type: none"> ▪ Outcome measures evaluate performance under specific circumstances, often within the context of the stress or hazard for which they were designed. ▪ Examples include event response and recovery; biodiversity indicators of ecosystem conditions; measures of equity in recovery from an event or stress; local measures of climate and environmental changes; etc. Outcome measures may also be tied to evaluation tools used to prioritize actions (see Step 4).

1040 Most climate adaptation plans require a combination of process measures and outcome measures.
 1041 When developing measures, the planning team should determine which measures require the
 1042 identification of a baseline (e.g., current conditions) to compare with later conditions. Additionally,
 1043 performance metrics, like many parts of the plan, may need to be developed iteratively and re-
 1044 evaluated after strategies have been planned. In some cases, the planning team may find it
 1045 necessary to develop strategy-specific performance metrics. The case study below from Broward
 1046 County, FL provides example objectives found in a Climate Action Plan.

1047  **Case Study: Main Objectives for Broward County’s (FL) Climate Action Plan⁸²**

- 1048 ▪ Prioritize and support effective coordination and collaboration between agencies and
 1049 stakeholders.
- 1050 ▪ Use dynamic approaches to address uncertain and evolving conditions.
- 1051 ▪ Utilize the Unified Sea Level Rise Projection for Southeast Florida for sea level rise
 1052 adaptation planning and support adaptation of at-risk infrastructure and facilities.

⁸¹ Boltz, Frederick, Elizabeth Losos, Rachel Karasik, and Sara Mason, Resilience Roadmap: Developing Key Performance Indicators for Climate Change Adaptation and Resilience Planning,” Nicholas Institute for Environmental Policy Solutions, (Duke University 2022), <https://nicholasinstitute.duke.edu/sites/default/files/publications/developing-key-performance-indicators-for-climate-change-adaptation-and-resilience-planning.pdf>.

⁸² Broward County, *Broward Climate Action: Resilience Under the Sun* (2020). https://www.broward.org/Climate/Documents/CCAP_2020_ADA.pdf.

- 1053 ▪ Reduce waste and consumption of non-renewable energy.
- 1054 ▪ Strengthen communication and advocacy efforts to increase community resilience;
- 1055 establish and reinforce principles of equity and secure funding for adaptation.
- 1056 ▪ Actively protect natural areas and promote green infrastructure.
- 1057 ▪ Educate residents on climate-related risk.

1058 For a broad inventory of resilience metrics, see the [National Institute of Standards and Technology's](#)
1059 [\(NIST\) Inventory of Community Resilience Indicators and Assessment Frameworks](#).

Key Takeaways for Emergency Managers: Step 3

- 1061 ▪ Collaborate with community partners to outline the desired outcomes of the plan and the
- 1062 objectives that can frame individual actions or strategies.
- 1063 ▪ Ensure that objectives are targeted and actionable and incorporate the perspectives and
- 1064 priorities of the collaborative planning team established in [Step 1](#).
- 1065 ▪ Lead or participate in the development of performance metrics that can be used to
- 1066 measure the effectiveness of the goals and objectives.

1067 4.4. Step 4: Develop the Plan

1068 Step 4 of emergency operations planning described in *CPG 101* focuses on developing courses of
1069 action to accomplish goals and objectives established during [Step 3](#). In climate adaptation planning
1070 Step 4, this step focuses on identifying and prioritizing the strategies and actions that the jurisdiction
1071 will take to address climate-related risks, and the resources and information necessary to implement
1072 those actions. The outputs of this step are then used to write and review the plan in [Step 5](#).

1073 Develop and Analyze Resilience Strategies

1074 [Steps 2](#) and [3](#) identified the community's climate-related risks, their impacts, and the community's
1075 goals and objectives. Using this information, the planning team now identifies strategies and actions
1076 to avoid or mitigate those risks and achieve the identified goals and objectives. This process involves
1077 not only technical staff and subject matter experts, but also includes community outreach to collect
1078 public input on strategies and actions. Adaptation plans typically include a broad range of strategies
1079 and actions, some strategies or actions may be mutually exclusive (e.g., disaster waste management
1080 or electric car charging stations along evacuation routes).

1081 Although the identification of adaptation strategies and actions is a locally led process, there are
1082 many resources that present information on different types of adaptation strategies. For example:

- 1083 ▪ SLTT communities now have more access to cleaner (low carbon) materials through eligible
1084 FEMA programs as communities rebuild or take initiatives to become more resilient. This ensures
1085 communities can help advance the clean energy economy as they confront the impacts of
1086 the climate crisis.⁸³
- 1087 ▪ The [U.S Climate Resilience Toolkit](#) provides a wide range of possible adaptation strategies and
1088 actions relating to the built environment, coasts, ecosystems, energy, food, health, marine,
1089 transportation,⁸⁴ tribal organizations, and water. The [Drought and Infrastructure - A Planning
1090 Guide](#) can be used to anticipate and prepare for the consequences of drought on infrastructure
1091 services. The toolkit also includes filterable [case studies](#) by climate threat (or stressor), topic,
1092 resilience step, or region.⁸⁵
- 1093 ▪ The EPA's [Strategies for Climate Change Adaptation](#) identifies strategies that can be applied to
1094 the natural environment (e.g., air, water, waste and public health).⁸⁶

1095 Many climate adaptation plans focus on physical (engineered) improvements to structures and
1096 infrastructure or emphasize the importance of education and raising awareness of climate-related
1097 risks. In addition to the physical improvements, ecosystem or nature-based adaptation strategies
1098 use biodiversity and ecosystems as a means of reducing climate-related risks. An example of this is
1099 extending or enhancing coastal wetlands to protect the land located behind them.

1100 Most adaptation strategies and actions focus on achieving one or more objectives. For example, a
1101 plan might have twin objectives of reducing the sensitivity of stormwater infrastructure to extreme
1102 rainfall events and reducing biodiversity loss throughout the community. Broader use of “green”
1103 infrastructure design concepts could be an applicable adaptation strategy for both objectives.

1104 Adaptive capacity, on the other hand, is the ability of individuals or systems (e.g., infrastructure, a
1105 community, an ecosystem) to adjust to climate stresses. One objective might be to increase the
1106 adaptive capacity of critical infrastructure. A corresponding strategy might be building redundancy
1107 into network operations so that functionality lost through damage to one portion of a network is
1108 automatically replaced with functionality from another portion of the network. Consider the pros and
1109 cons along a green to gray infrastructure continuum (see [Figure 11](#) for a coastal shoreline).

⁸⁶ USEPA, *Strategies for Climate Change Adaptation*, (2022), <https://www.epa.gov/arc-x/strategies-climate-change-adaptation>.

How **GREEN** or **GRAY** should your shoreline be?

1110

1111

Figure 11: Coastal Shoreline Continuum⁸⁷

1112

Different types of strategies can be used to implement adaptation actions. In some cases, existing institutional mechanisms or structures, such as changing [building codes](#),⁸⁸ may make implementation straightforward. In other instances, implementation may need to be tailored to current institutional structures (e.g., government agencies, organizations), or a new structure put in place.

1117

Examples of Implementation Strategies⁸⁹

1118

- **Legal/Regulatory:** Useful for ensuring a minimum standard of performance or condition but often difficult to use politically.

1119

1120

- **Market:** Includes such tools as financial incentives, grants, interest-free loans, taxes and fees. Fairly flexible in implementation, but desired outcome is not guaranteed due to uncertainty in individual, household, organization, or agency behavior. Often used to create a niche market for certain types of adaptation strategies.

1121

1122

1123

1124

- **Partnerships:** Voluntary agreements or compacts among agencies and organizations to achieve desired outcomes. Effectiveness depends on the ability of participants to assign

1125

⁸⁷ For more information on *Understanding Living Shorelines*, see <https://www.fisheries.noaa.gov/insight/understanding-living-shorelines>.

⁸⁸ For more information on FEMA's Building Code Strategy, see <https://www.fema.gov/emergency-managers/risk-management/building-science/building-codes-strategy>.

⁸⁹ Adapted from: European Commission, *Guidelines on developing adaptation strategies*, Commission Staff Working Document SWD, 134 final, (2013).

1126 the staff and funding resources to make the partnership work. Pooled resources of
1127 participants often raise questions of appropriate contributions to the partnership.

1128 ▪ **Persuasion and Awareness:** Usually implemented through web-based communication and
1129 exchange capabilities, in-person outreach, newsletters and awareness campaigns. Helps
1130 to develop support for plan and individual strategy implementation but rarely successful
1131 by itself in resulting in implementation.

1132 ▪ **Hybrid Planning:** Combination of different implementation strategies based on a
1133 systematic understanding of how the different strategies interconnect and interoperate to
1134 achieve community climate resilience.

1135 When identifying strategies and actions, it is important to consider and document implementation
1136 needs. These needs affect strategy/action selection and prioritization. The planning team should
1137 identify or establish an entity (e.g., agency, organization) to be responsible for the implementation of
1138 each strategy/action. The team should also outline the relationships that will provide leadership in
1139 the implementation phase. This includes making sure stakeholders have 1) a common
1140 understanding of desired outcomes and how individual strategies contribute to achieving them, 2) an
1141 understanding of the timeframe for implementation of each strategy, and 3) awareness of the key
1142 stakeholders and partners who might help implement the strategy.

1143 **Prioritize Actions**

1144 Once strategies have been identified, the next step is to determine which strategies and actions to
1145 prioritize. These priority strategies and actions then become the basis for the climate adaptation
1146 plan. Prioritization is driven by one primary question: which of the options best help achieve the
1147 adaptation plan goals and objectives given a range of possible climate futures? In other words,
1148 prioritization identifies robust actions that achieve optimal results across a range of climate
1149 scenarios. From an emergency management perspective, actions may include but are not limited to:

- 1150 ▪ Evacuation planning;
- 1151 ▪ Sheltering facilities;
- 1152 ▪ Floodplain management;
- 1153 ▪ Public information campaigns;
- 1154 ▪ Cooling and heating centers; and
- 1155 ▪ Mutual aid assistance.

1156 Prioritization is usually based on a set of criteria that reflect the most important community concerns
1157 relating to desired plan outcomes. The planning team should determine which criteria to use with the
1158 input of whole-community stakeholders. In some cases, quantitative criteria, such as monetary risk
1159 estimates or the population considered underserved to a particular hazard, are used. In other cases,
1160 the criteria could include subjective assessments of overall effectiveness or risks associated with
1161 each option. For example, some climate adaptation planning efforts use subjective values of low,
1162 medium or high, based on the collective opinions of experts, staff, decision-makers, or the general

1163 public. And in some cases, such efforts have used a combination of quantitative and qualitative
1164 assessments.

1165 Examples (in alphabetical order) of criteria that are often found in prioritization efforts include:

- 1166 ▪ **Benefit-Cost analysis:** In some cases, it is possible to estimate the cost of implementing a
1167 particular action as well as to assign monetary values to the expected benefits of
1168 implementation. This could be done in a straightforward manner, such as measuring the benefits
1169 of reduced damage to buildings, or may require a more nuanced approach, such as assigning a
1170 monetary value to social and environmental benefits (e.g., positive health impacts). Using
1171 benefit-cost analysis examines strategies through a monetary lens, weighing whether the
1172 benefits exceed the cost. Such analyses can also be used to determine the extent to which one
1173 action is more beneficial than another.
- 1174 ▪ **Co-benefits:** Does the strategy or action have additional, perhaps unquantifiable, benefits beyond
1175 enhanced climate resilience for the community? All things being equal, those strategies and
1176 actions that provide additional benefits would be preferred over those that do not.
- 1177 ▪ **Cost-effectiveness:** In many cases, the cost to implement a strategy or action can be estimated,
1178 along with the outcome (or benefit) expected from the investment. Cost-effectiveness criteria
1179 estimate the expense that is required to produce a given outcome or output. Examples include
1180 the average dollar amount needed, per home, to harden against tropical storms; the cost to
1181 reduce a community population’s vulnerability to a specific potential hazard by X percent; and
1182 the investment necessary to reduce the incidence of a serious health hazard to X percent.
- 1183 ▪ **Equity:** Assessing the equity impacts of climate adaptation strategies begins with evaluating how
1184 different demographic groups benefit or are harmed from a given action. Key questions include:
1185 what individuals or community groups are reaping benefits and who is negatively affected?
1186 Special consideration should be given to historically underserved groups, such as low-income,
1187 minority, elderly, chronically sick, and mobility impaired people and households. The intent of the
1188 equity criterion is to allocate the benefits and costs of climate adaptation investment equitably
1189 across a community in a manner that reduces, rather than perpetuates, existing inequities.
- 1190 ▪ **Flexibility:** Given the uncertainty in the timing and scale of climate hazards and risks, many
1191 climate adaptation plans emphasize strategies and actions that can be phased in over time, or
1192 whose adaptive capabilities can be easily expanded.
- 1193 ▪ **Implementation feasibility.** This criterion reflects the legal, financial, organizational, political, and
1194 social challenges associated with implementing a strategy or action. Some strategies may offer
1195 significant risk reduction potential yet face major political or social barriers. Alternatively, some
1196 strategies may be “low-hanging fruit” and able to be quickly and easily implemented.
- 1197 ▪ **Robustness:** Given the uncertainty of future climate conditions, strategies that provide resilience
1198 benefits under different scenarios are preferable over those whose benefits only occur with one
1199 possible future. This is particularly applicable to strategies or actions that mitigate current

1200 threats, hazards, or risks and provide long-term benefits at the same time. This analysis should
1201 also consider timing and the consequences of taking no action. A particular action may be
1202 significantly more costly or ineffective (e.g., conservation of key habitat) if the action is delayed.

1203 **Identify Resource and Information Needs**

1204 After selecting strategies and actions undertaken, planners identify the resources and information
1205 needed to carry out actions of the adaptation plan. Resource requirements will vary widely
1206 depending on the strategies/actions selected and can encompass a wide range of items, such as
1207 engineering or construction equipment; site-specific analytics, including measurement or analytical
1208 tools (e.g., drones, computers); external funding; new hires or volunteers; land needs, natural
1209 resources (e.g., seeds, saplings), and/or habitat-specific interventions (e.g., endangered species).
1210 Resources should be listed without regard to current availability. Then, the planning team can
1211 identify what resources are currently available and what will need to be obtained moving forward.

1212 Partnerships, such as through mutual aid agreements, are an important method for obtaining
1213 resources not readily available to a community, particularly for smaller or under-resourced
1214 communities. Identifying regional partners that either (a) have the needed resource, or (b) have a
1215 similar need for the same resource, can help cut costs and establish mutually beneficial working
1216 relationships. These partners may be governmental or non-governmental. Local businesses, for
1217 example, may be willing to provide certain resources or be willing to help fund their acquisition.
1218 External funding sources, such as federal or state grants, are another good mechanism for obtaining
1219 needed resources (see [Appendix C](#) for a list of emergency management funding resources).

1220 **Key Takeaways for Emergency Managers: Step 4**

- 1221 ▪ Lead or participate in the multi-agency and multidisciplinary process of identifying and
1222 prioritizing strategies and actions to enhance community resilience.
- 1223 ▪ Draw upon experience and local knowledge of past hazard events in the formation of
1224 adaptation strategies and actions.
- 1225 ▪ Encourage innovation in developing new strategies and actions.
- 1226 ▪ Contribute to the preparation of the climate adaptation plan by linking information relating
1227 to the local hazard mitigation plan, recent experience with climate-related hazards and
1228 community preparedness.
- 1229 ▪ Identify the physical, financial, or institutional resources and information needed to
1230 implement strategies/actions.

1231 **4.5. Step 5: Prepare and Review the Plan**

1232 [Step 4](#) resulted in a set of prioritized strategies and actions for enhancing community resilience to
 1233 climate change-related threats, hazards and risks. The next step is to prepare and review the plan.
 1234 This includes writing the actual plan, leveraging the information from [Steps 2, 3,](#) and [4](#) of the
 1235 planning process.

1236  **Climate Adaptation Plans Components:**

- 1237 ▪ A summary of the expected climate impacts to the community and region; background on
 1238 the methods and approach used to evaluate risk; the results of the local and regional risk
 1239 analysis; and key threats to underserved populations and important community assets.
- 1240 ▪ Specific goals and objectives that outline the long-term desired outcomes for the
 1241 community and break these goals into targeted and actionable steps.
- 1242 ▪ Strategies, actions, and responsibilities to achieve one or more objectives through targeted
 1243 policy, investment, engagement, operational changes, and/or institutional reform.

1244 Review of a climate adaptation plan follows a similar pattern to that for traditional planning. First, the
 1245 planning team should review the plan and then make it available to other pertinent stakeholders.
 1246 Given that the adaptation plan may be the first within a jurisdiction, it may be useful to review peer
 1247 community plans and use these as a source of comparison. This can help identify areas that are
 1248 underdeveloped in the current draft plan, such as the rigor of the performance metrics. Similar to the
 1249 process in *CPG 101*, three criteria can be used when evaluating the plan:

- 1251 ▪ **Adequacy:** Does the scope of the plan include the primary (and ideally secondary) climate threats
 1252 to the community? Do the plan's goals, objectives, strategies and actions propose a course for
 1253 mitigating climate-related risk? Are the plan's assumptions (e.g., climate science) valid?
- 1254 ▪ **Feasibility:** Are the organizations/agencies capable of accomplishing assigned tasks, either with
 1255 available resources or with reasonable expectation of securing necessary resources? Are the
 1256 timeline and project size sufficient to meet the stated need and practical? Can coordination with
 1257 necessary stakeholders or government agencies be secured?
- 1258 ▪ **Acceptability:** Do the adaptation strategies meet the threats posed by climate change? Are the
 1259 strategies and objectives designed to be equitable and achieve social as well as physical
 1260 resilience? Is the plan consistent with the law and with relevant guidance?
 1261

1262 These criteria can be used to evaluate the plan’s goals, objectives, and strategies, along with how
1263 they are coordinated and allocated across agencies or stakeholders. Moreover, they can be useful in
1264 assessing whether the resources needed to implement a strategy or action are immediately available
1265 or whether outside funding sources will need to be pursued. The Tompkins County, NY case study
1266 below provides an example of a final climate adaptation chapter in a comprehensive plan.

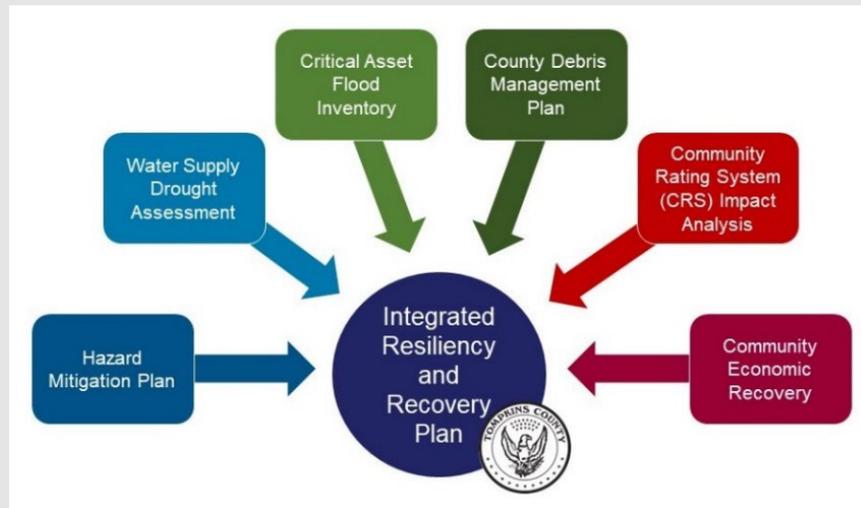

Case Study: Tompkins County, New York Climate Adaptation Strategy

1268 The [Tompkins County \(NY\) Comprehensive Plan](#) includes a [chapter on adaptation](#). This chapter
1269 indicates that “it is the policy of Tompkins County to:

- 1270 ▪ Maintain floodways and limit floodplain development to reduce damages from flooding;
- 1271 ▪ Improve connectivity of open space to prevent fragmentation of ecosystems and isolation
1272 of plant and wildlife populations;
- 1273 ▪ Promote adaptation measures that lessen climate impacts on the local economy;
- 1274 ▪ Encourage actions that protect underserved populations from climate change impacts;
- 1275 ▪ Prepare for community recovery in the event of disaster.”

1276 The Tompkins County Department of Planning and Sustainability also developed a Resiliency
1277 and Recovery Plan to help reduce the risks associated with hazards and the changing climate.
1278 The plan lays a foundation for collaborative action with each of the municipalities in Tompkins
1279 County and a broad group of stakeholders. It addresses four critical areas from the County’s
1280 Hazard Mitigation Plan: Flooding, Drought, Debris Management, and Economic Recovery.

1281
1282 **Figure 12: Plan Integration in Tompkins County’s (NY) Climate Adaptation Plan⁹⁰**

⁹⁰ Tompkins County NY, Tompkins County Resiliency and Recovery Plan (2022).
<https://tompkinscountyny.gov/planning/climate-adaptation>.

1283

Key Takeaways for Emergency Managers: Step 5

1284

- Lead or participate in multi-agency efforts to write and review the climate adaptation plan.

1285

- Help identify the roles and responsibilities of stakeholders to carry out the plan.

1286

- Provide information on possible funding sources for implementing planned

1287

strategies/actions.

1288

4.6. Step 6: Implement and Maintain the Plan

1289

Once reviewed, approved, and released, implementation and maintenance of the plan begins. This step focuses on monitoring and evaluating the performance of the plan, updating the plan as needed, and mainstreaming adaptation planning in the community.

1290

1291

1292

Implementation is a long-term process. Some tasks will occur soon while other strategies are implemented and updated over a course of years. The callout box below outlines key considerations for implementation.

1293

1294

1295

Considerations When Implementing and Maintaining the Plan

1296

- Assigning sub-tasks to individuals, groups, or organizations;

1297

- Obtaining the financial resources to pay for implementation;

1298

- Developing interorganizational partnerships and agreements when implementation

1299

includes multiple players;

1300

- Developing a constituency for the different actions among key stakeholders and the public; and

1301

1302

- Linking assigned actions to the decision-making processes of that organization(s).

1303

As with most planning efforts, climate adaptation planning is an iterative process that entails regular reviews and adjustments. Updates are particularly important for climate adaptation planning where advances in climate science occur constantly, new data sources become available, intervening extreme weather events provide new information on the severity and extent of the resulting damage, and the communities themselves change in various ways.

1304

1305

1306

1307

1308 **Monitor and Evaluate Performance**

1309 Monitoring and evaluating the performance of the
1310 plan and regularly reviewing the underlying
1311 assumptions is an important part of assessing
1312 whether a community's climate adaptation plan is
1313 still relevant and appropriate and meeting the
1314 desired outcomes. Monitoring should address the
1315 criteria in the performance metrics designed in
1316 [Step 3](#) but should also ensure the underlying
1317 assumptions that led to the selection of adaptation
1318 strategies are still valid. For example, monitoring
1319 should collect information on changing climate and community characteristics, advancements in
1320 climate science or technology, and performance of risk reduction and other adaptive strategies. This
1321 information provides an important feedback loop to determine whether adjustments to the plan are
1322 needed. Analyzing individual strategy effectiveness could lead to minor adjustments or they might
1323 suggest a rethinking of the entire strategy.

1324 Ideally, an agency or multi-agency structure would be designated to lead the implementation,
1325 monitoring, evaluation, and revision of the plan. For some communities, this may be the emergency
1326 management agency, who is already monitoring for hazard mitigation plans and THIRAs as well as
1327 evaluating exercises and real-world events through after-action reports.

1328 **Update the Goals, Objectives, and Metrics of**
1329 **the Plan**

1330 Revising or updating a climate adaptation plan can
1331 occur periodically, such as every five years or when
1332 circumstances dictate, such as in the aftermath of
1333 a particularly severe extreme weather event. The
1334 plan should establish this process and the update
1335 should be undertaken by the same (emergency
1336 management) agency or multi-agency structure
1337 that coordinates monitoring and evaluation.
1338 Updating the plan might include altering how a goal
1339 or objective is being implemented, or it may involve
1340 altering the strategy itself. In the latter instance,
1341 strategy changes should be vetted with leadership
1342 to ensure that their implementation is feasible.
1343 Even evaluating what strategies and
1344 implementation practices have been ineffective is
1345 a useful learning exercise for future planning
1346 efforts.

Exercise the Plan

FEMA's [Long-Term Community Resilience Exercise Resource Guide](#) is a "one-stop-shop" for any jurisdiction or organization looking to conduct a climate-focused exercise.

Source: <https://www.fema.gov/node/long-term-community-resilience-exercise-resource-guide>.

Factors for Updating Climate Plans

- New information on climate science
- New tools and data for vulnerability and risk analysis
- Experience with recent extreme weather events
- Community development patterns
- Population characteristics
- Community values
- Updates to other community plans and strategies
- Addition of new staff and expertise
- New technology innovations that change demand and service patterns
- Laws and regulations

Key Takeaways for Emergency Managers: Step 6

1347

1348
1349

- Participate in multi-agency efforts to raise community awareness of the need to implement adaptation plan recommendations.

1350
1351

- Collect data and information on climate-related hazards to inform future plan updates and monitor the performance of implemented strategies.

1352
1353

- Lead or participate in evaluating whether implemented and recommended adaptation strategies are still appropriate given changing environmental conditions.

1354
1355

- Coordinate changes in the local hazard mitigation plan with the strategies of the adaptation plan and its monitoring and evaluation.

1356

DRAFT

1357 5. Conclusion

1358 The purpose of this guide is to help SLTT emergency managers incorporate climate adaptation into
1359 emergency management planning efforts. The six-step planning process presented here is broadly
1360 applicable to many different climate adaptation planning contexts, yet the individual actions and
1361 planning roles are designed to help SLTT emergency managers both lead and support adaptation
1362 planning. Emergency managers' experience identifying and mitigating hazardous threats and
1363 vulnerabilities can be of great use in planning for long-term community resilience and adaptation
1364 even as climate change continues to be a "risk multiplier."

1365 Many of the initial steps in the climate adaptation planning process presented here are similar to
1366 those used in [CPG 101](#); however, as described earlier, there are several key differences:

1367 1) While planning and preparing for emergencies always involves uncertainties and a need to
1368 assess risks, climate-related threats magnify this uncertainty due to an inability to predict future
1369 emissions and climate mitigation policies. Therefore, adaptation planning should address multiple
1370 climate scenarios (e.g., intermediate emissions, high emissions) and investigate which projections
1371 are most applicable to the community.

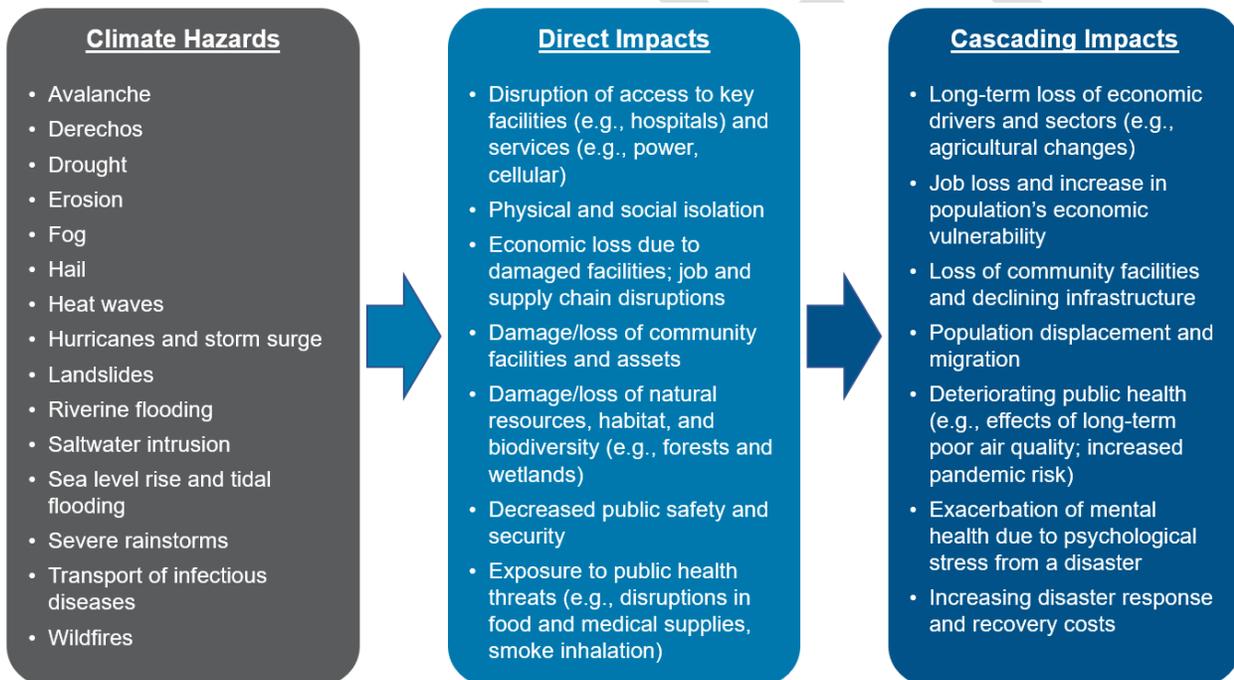

1372 2) Actions to address climate change, as well as knowledge of climate science and vulnerabilities,
1373 are constantly evolving. Planning for climate-resilient communities should become an iterative
1374 process to ensure that strategies and plan priorities reflect the best information available.
1375 Furthermore, exercising, monitoring and adjustment of plan implementations ought to occur
1376 regularly to optimize the effectiveness of adaptive actions. Changing economic and demographic
1377 considerations may also necessitate adjustments to the plan or its implementation.

1378 3) Creating and sustaining a climate-resilient community is most feasible when adaptive responses
1379 are incorporated into all aspects of community planning and decision-making. For example,
1380 decisions about future land use or capital improvement projects ought to include climate
1381 considerations, such as shifting flood hazard areas or infrastructure design standards. Moreover, the
1382 equity implications of both climate impacts and responses should be an important part of the
1383 discussion both in creating the adaptation plan and in developing other community plans and
1384 policies. In this and many other cases, a broad, community-wide approach to climate resilience is
1385 important. A thorough and iterative planning process, along with strong community partnerships that
1386 draw on a range of social and technical expertise, will create a strong foundation for building and
1387 sustaining a climate-resilient community.

1388 **Appendix A: Climate Impacts on Emergency Response**
 1389 **and Recovery Planning**

1390 Climate change is a risk multiplier. The hazards that regions and communities are occasionally
 1391 exposed to will become more frequent, more severe, and afflict new areas. Some of the most
 1392 damaging events have been the result of combined weather phenomena, producing multiple
 1393 hazards simultaneously. Hurricane Sandy, for example, was the combined result of a nor'easter and
 1394 a hurricane, producing devastating results. Natural hazards can also co-occur with other phenomena
 1395 amplifying the overall risk. In 2021, Louisiana was hit by the second-most damaging hurricane in the
 1396 state's history, Hurricane Ida, in the midst of the COVID-19 pandemic, putting greater stress on the
 1397 area's hospitals, among other social and economic impacts of the pandemic.

1398 [Figure A-1](#) highlights some hazards that will become more widespread or more severe due to climate
 1399 change. The figure also lists potential direct (or primary) and cascading (or secondary) impacts.

1400
 1401 **Figure A-1: Climate Hazards and Their Direct and Cascading Impacts**

1402 Weather extremes associated with climate change will also likely directly impact or cause cascading
 1403 impacts to response planning and into recovery. Using the eight Community Lifelines and Recovery
 1404 Support Functions (RSFs), below is a bulleted list of direct or cascading impacts from an emergency
 1405 response and recovery perspective.⁹¹

⁹¹ For more information on FEMA's Response and Recovery Climate Change Planning Guidance, see https://www.fema.gov/sites/default/files/documents/fema_response-recovery_climate-change-planning-guidance_20230630.pdf.

1406 **Safety and Security Lifeline**

- 1407 ▪ An anticipated increase in climate-related events may strain SLTT response resources and
- 1408 capacities, resulting in increased requests for federal support.
- 1409 ▪ Decreased water volumes in remote streams and ponds may hamper firefighting capabilities.
- 1410 ▪ Persons with disabilities and those who live in rural areas have restricted (or lack) access to
- 1411 government services.
- 1412 ▪ Under-resourced populations and communities may lack access to capital that could help
- 1413 support resilience investments.

1414 **Food, Hydration, Shelter Lifeline**

- 1415 ▪ Temperature and precipitation extremes may affect water quality and availability, agricultural
- 1416 productivity, and ecosystems and species.
- 1417 ▪ Thawing permafrost may lead to unsafe food storage and preservation.
- 1418 ▪ People with disabilities have high rates of illness, injuries, or death during extreme events, as
- 1419 cognitive, hearing, physical, and mobility impairments may impede their safe evacuation.
- 1420 ▪ Sheltering needs may overwhelm SLTT capacities due to increases in climate-related events.
- 1421 Federal support may be required for the provision of additional sheltering and/or the relocation
- 1422 of impacted populations to unaffected areas.
- 1423 ○ Wrap-around services may need to be provided for survivors waiting to access aid sites to
- 1424 ensure their health and well-being (e.g., moving water distribution to shaded areas in
- 1425 extreme heat scenarios). Pre-identified aid sites may need to be reevaluated to ensure
- 1426 protection for those awaiting access.

1427 **Health and Medical Lifeline**⁹²

- 1428 ▪ More frequent and severe heat waves will lead to more heat-related illnesses and deaths.
- 1429 ▪ Changes in the timing and lengths of the seasons may cause shifts in the geographic areas
- 1430 where disease-carrying insects such as mosquitoes, ticks, and fleas typically transmit West Nile
- 1431 Virus, dengue fever, Lyme disease, malaria, and other diseases.
- 1432 ▪ Increasing temperatures may cause degradation of air quality, exacerbating health conditions
- 1433 such as heart disease.
- 1434 ▪ Increased plant growing seasons may increase pollen exposure and allergies, a greater number
- 1435 of severe storms will increase mold exposures, and increased temperatures and wildfire risk will
- 1436 lead to more air pollution, all of which can worsen lung diseases and other health problems.
- 1437 ▪ Extreme weather events are associated with an increased risk of food- and water-borne illnesses,
- 1438 as sanitation services, hygiene measures, and safe food and water supplies are often
- 1439 compromised after such events.
- 1440 ▪ An increase in the loss of patient medications is expected due to a larger number of power
- 1441 outages and subsequent lack of refrigeration capabilities.

⁹² U.S. Department of Health and Human Services, *Climate Change and Health Equity* (2022).
<https://www.hhs.gov/climate-change-health-equity-environmental-justice/climate-change-health-equity/index.html>.

- 1442 ▪ Increasing frequency and severity of wildland fires will reduce ambient air quality causing
1443 increases in respiratory distress, especially among those with respiratory ailments, children, and
1444 the elderly.

1445 **Energy (Power Grid and Fuel) Lifeline**

- 1446 ▪ Transmission line capacity will decline at higher temperatures, reducing power availability;
1447 extreme heat may also cause powerlines to droop.⁹³
1448 ▪ Extreme temperatures increase demand for cooling and heating capabilities, which may result in
1449 electricity shortfalls.
1450 ▪ Climate-related incidents, such as increases in extreme heat and wildfires, will increase the
1451 likelihood of public safety power shutoffs, limiting access to power.
1452 ▪ Extreme flooding or severe weather will threaten energy infrastructure.
1453 ▪ Frontline communities are historically the last communities to have their utilities restored.

1454 **Communications Lifeline**

- 1455 ▪ Extreme flooding or severe weather may impact communications infrastructure due to damage
1456 or loss of power.
1457 ▪ Buried fiber optic cables and nodes, which provide communications and internet services, are at
1458 risk of failure due to sea level rise and flooding. Similar fiber optic cable issues may occur above
1459 ground due to high winds associated with hurricanes, derechos, and other extreme weather
1460 events. Communications nodes are often clustered at low elevations around dense populations.
1461 Fiber buried on land is water- and weather-resistant but is not designed to be submerged.⁹⁴
1462 ▪ Persons with access and functional needs will require the need of assistive technology or other
1463 communication support to receive information and how to respond during a disaster.

1464 **Transportation Lifeline**

- 1465 ▪ Extreme heat can warp railways and impact rail operations, cause paved surfaces to buckle and
1466 disrupt transit, and also make it difficult for airplanes to take off.⁹⁵
1467 ▪ Higher winds and wildland fires may disrupt air traffic.
1468 ▪ An increase in flooding or weather events that result in the accumulation of debris will impact
1469 transportation routes.
1470 ▪ More than 60,000 miles of roads and bridges in coastal areas are at risk of flooding from
1471 climate-change-related sea level rise.⁹⁶

⁹³ National Public Radio. *During the heat wave in the Pacific Northwest in 2021, the intense heat melted some power cables in Portland.* (2021). <https://www.npr.org/2021/06/29/1011269025/photos-the-pacific-northwest-heatwave-is-melting-power-cables-and-buckling-roads>.

- 1474
- 1475
- 1476
- 1477
- 1478
- 1479
- 1480
- Permafrost thaw may reduce the viability of roads made of ice and snow and damage transportation infrastructure due to ground sinking.⁹⁷
 - Compounding climate-related weather events that impact the transportation system could severely impact supply chains due to worker attrition, flooded routes, etc. Disruptions to supply chains will impact operations, logistics, and management activities for response and recovery.
 - The development of community-specific distribution management plans that highlight vulnerable transportation infrastructure and alternate commodity points of distribution should be supported.
 - Disruptions to transportation infrastructure can affect communities and their access to food, healthcare systems, and social services.

1481 **Hazardous Materials Lifeline**

- 1482
- 1483
- 1484
- 1485
- 1486

- 1495
- 1496
- 1497
- Increased climate-related weather events may result in larger quantities of waste materials requiring processing. This may lead to increased GHG emissions from waste management activities as well as insufficient capacities for handling surges in the necessary recycling, treatment, and disposal processes for the waste generated.⁹⁸
 - Extreme weather events may impact industrial facilities resulting in contamination of surrounding communities (often low-income communities) requiring permanent evacuation and exposure to hazardous materials.
 - Severe storms and heavy flooding are likely to result in industrial process disruptions which could result in autocatalytic reactions, explosions, and discharges when a facility is not able to store chemicals at the proper temperature on alternate power sources or properly shut down continuous flow process.
 - Low-income communities may be disproportionately impacted by hazardous materials events due to their proximity to hazardous facilities or transportation routes. These communities may also have limited resources to respond to and recover from such events.
 - Indigenous communities that practice subsistence farming and fishing are particularly vulnerable to the impacts of hazardous materials.

1498 **Water Systems Lifeline**

- 1499
- 1500
- 1501
- 1502
- Thawing permafrost may lead to the deterioration of reservoirs and impoundments that rely on the existence of permafrost for wastewater containment.
 - The intersection of flooding and warmer weather may cause bacterial growth in local water sources, leading to health concerns (e.g., toxic algae blooms).

⁹⁸ EPA. *Waste Management Planning to Mitigate the Impact of Climate Change*. <https://www.epa.gov/homeland-security-waste/waste-management-planning-mitigate-impact-climate-change>.

1503 **Economic Recovery Support Function**

- 1504 ▪ Labor hours lost by weather-exposed workers due to high temperature days.⁹⁹ There is also an
1505 equity consideration on the demographics of weather-exposed workers, who will be more
1506 impacted by climate change.
- 1507 ▪ Increase in property damage and business income losses due to increasing frequency and
1508 intensity of climate-related hazards.
- 1509 ▪ The displacement of socially vulnerable and underserved people may often coincide with the
1510 displacement of essential, front-line workers who are the foundation of a community's economy.

1511 **Health and Social Services Recovery Support Function**

- 1512 ▪ Individuals are at higher risk of developing chronic illnesses such as asthma, or fatalities from
1513 cancer, residing in areas with higher counts of particulate air pollution.¹⁰⁰

1514 **Community Assistance Recovery Support Function**

- 1515 ▪ Equity issues regarding illiteracy should be taken into consideration when conducting community
1516 engagement and training.
- 1517 ▪ Community assistance efforts and climate considerations should be incorporated into long-term
1518 recovery planning support strategies.
- 1519 ▪ FEMA should partner with the federal interagency, when possible, to leverage other agency
1520 authorities that support mitigation activities and build climate resilience.

1521 **Infrastructure Systems Recovery Support Function**

- 1522 ▪ Projects should [leverage resilience funding support](#)¹⁰¹ for projects that adhere to consensus-
1523 based building codes and standards for low-carbon materials.
- 1524 ▪ Recovery-funded grant projects should emphasize mitigation measures (e.g., through the Hazard
1525 Mitigation Grant Program [HMGP] and 406 Mitigation funding) that support risk reduction
1526 actions, climate adaptation actions, and nature-based or green infrastructure solutions.
- 1527 ▪ Benefit-cost calculations should be streamlined for hazard mitigation solutions that are local,
1528 sustainable, and nature based, when possible, to enable better alignment with grant obligations
1529 and planning timelines.

1530 **Housing Recovery Support Function**

- 1531 ▪ Temporary housing and sheltering will continue to be a prominent and challenging aspect of
1532 disaster recovery. FEMA will undertake state-led pre-disaster planning initiatives on housing to

⁹⁹ EPA. *Social Vulnerability Report*. https://www.epa.gov/system/files/documents/2021-09/climate-vulnerability_september-2021_508.pdf.

¹⁰⁰ National Institutes of Health. The Impact of Disasters on Populations with Health and Health Care Disparities. <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC2875675/>.

¹⁰¹ FEMA. *Recovery and Resilience Resource Library*. <https://www.fema.gov/emergency-managers/practitioners/recovery-resilience-resource-library>.

1533 build greater resilience to climate-related disasters and encourage better planning and
1534 preparedness practices.

1535 **Natural & Cultural Resources Recovery Support Function**

- 1536 ▪ FEMA Recovery programs support the widespread adoption of the Federal Flood Risk
1537 Management Strategy and policy updates to ensure its implementation.
- 1538 ▪ Anticipated increase in the frequency and intensity of weather events will pose a heightened risk
1539 to the protection of cultural heritage resources, which in recovery are a shared responsibility of
1540 FEMA's Office of Environmental and Historic Preservation, the Heritage Emergency National Task
1541 Force, and the Natural and Cultural Resources RSF.

1542

DRAFT

1543 Appendix B: Climate Data and Mapping Applications

- 1544 ▪ [Climate Risk and Resilience Portal \(ClimRR\) \(Center for Climate Resilience and Decision](#)
1545 [Science\)](#):¹⁰² A public-private partnership that represents the newest developing climate science
1546 modeling. ClimRR empowers individuals, governments, and organizations to examine simulated
1547 future conditions at mid- and end-of-century for a range of climate perils. Additional hazards will
1548 be added over time. The ClimRR National Map Explorer allows users to view over 100 different
1549 climate visualizations in an interactive map and the ClimRR Local Climate Summary provides
1550 users with a snapshot of climate projections for a chosen location.

- 1551 ▪ [Climate Mapping for Resilience and Adaptation \(CMRA\) \(USGCRP/NOAA\)](#):¹⁰³ CMRA aggregates
1552 currently available federal datasets to create a climate risk information tool that also includes
1553 grant finance opportunities and policy information. This tool is a community-focused, user-
1554 friendly model that provides high level trend information for state, local, tribal, and territorial
1555 communities. View real-time maps showing where climate-related hazards are occurring today.

- 1556 ▪ [Climate Explorer](#):¹⁰⁴ The Climate Explorer offers graphs, maps, and data downloads of observed
1557 and projected climate variables for every county in the U.S. For the contiguous U.S., the tool
1558 shows projected conditions for two possible futures: one in which humans make a moderate
1559 attempt to reduce global emissions of heat-trapping gases, and one in which human emissions
1560 of heat-trapping gases continue increasing through 2100.

- 1561 ▪ [FEMA National Risk Index \(NRI\) for Natural Hazards](#):¹⁰⁵ The National Risk Index is an online
1562 mapping application from FEMA that identifies communities most at risk to 18 natural hazards.
1563 This application visualizes natural hazards risk metrics and includes data about expected annual
1564 losses from natural hazards, social vulnerability, and community resilience.

- 1565 ▪ [FEMA Resilience Analysis and Planning Tool \(RAPT\)](#):¹⁰⁶ A Geographic Information System
1566 planning tool to inform strategies for emergency management. RAPT includes over 100
1567 preloaded layers including FEMA’s Community Resilience Index, Census demographic data,
1568 infrastructure, live weather, hazards, NOAA sea level rise projections, and ClimRR future
1569 conditions data.

- 1570 ▪ [Drought.gov](#):¹⁰⁷ The National Integrated Drought Information System is a multi-agency
1571 partnership that coordinates drought monitoring, forecasting, planning, and information at
1572 national, tribal, state, and local levels.

¹⁰² For more information on ClimRR, see <https://climrr.anl.gov>.

¹⁰³ For more information on CMRA, see <https://resilience.climate.gov/>.

¹⁰⁴ For more information on the Climate Explorer, see <https://toolkit.climate.gov/tool/climate-explorer-0>.

¹⁰⁵ For more information on the NRI, see <https://www.fema.gov/flood-maps/products-tools/national-risk-index>.

¹⁰⁶ For more information on RAPT, see <http://fema.gov/rapt>.

¹⁰⁷ For more information on Drought.gov, see <https://www.drought.gov/>.

1573 **Appendix C: Financing Climate Adaptation and Mitigation**

1574 Policies, plans and strategies to mitigate climate change risks are of limited use if they are not
1575 adequately funded and resourced. The Federal government, SLTT governments, regional planning
1576 bodies, the private sector, and philanthropic organizations regularly provide funding for climate-
1577 related risk mitigation projects. Savvy planners can make use of many existing programs to support
1578 climate-related risk mitigation activities even if the programs do not exist to specifically combat
1579 climate-related risks. For instance, many federal grant dollars to upgrade infrastructure or mitigate
1580 natural hazards (most of which are influenced by climate change) can be used to achieve a variety of
1581 objectives including climate-related risk mitigation. The [Funding Strategies for Flood Mitigation](#)
1582 handout depicts funding sources for climate-related risk mitigation and resilience-building activities.
1583 Perhaps most important, thinking with a climate-resilient mindset can help planners find creative
1584 funding sources for climate-related risk mitigation activities.

1585 The remainder of this section reviews programs that provide funding that may often be used to
1586 mitigate climate-related risks. This list is not comprehensive. Many other programs and funding
1587 sources exist and the following call out box provides some useful overview guides.

1588 **Funding and Financial Management Resources**

- 1589 ▪ [Disaster Financial Management Guide](#): Helps SLTT jurisdictions establish and implement
1590 sound disaster financial management practices.
- 1591 ▪ [U.S. Climate Resilience Toolkit](#): Provides a range of government entities and private
1592 foundations offering financial and technical resources to advance local adaptation and
1593 mitigation efforts in the U.S.
- 1594 ▪ [The Institute for Local Government, Budgeting and Financial Management](#): Provides access
1595 to numerous resources and case stories for engaging the public in the budgeting process,
1596 as well as a repository of budgeting/finance forms.
- 1597 ▪ [The Grants Learning Center](#): Allows users to explore available federal grants and financial
1598 assistance, learn about the laws and regulations for awards, examine grant eligibility,
1599 explore grant registration and management tools, and more.
- 1600 ▪ [The Ready-to-Fund Resilience Toolkit](#): Helps increase climate resilience and create thriving,
1601 just, and equitable communities by securing funding and finance for the physical and
1602 social infrastructure necessary for climate resilient communities.

1603 **Annual Program Funding Provided by Federal Agencies**

1604 This section details annual program funding from primarily federal sources. Several federal programs
1605 provide annual mitigation or mitigation-related funding to SLTT governments. The requirements for
1606 participation, eligibility, cost share, performance periods, acceptable uses of funds and other details
1607 vary from program to program. This section highlights some key programs that may support climate

1608 adaptation and mitigation activities. Planners should consult program-specific guidance to determine
1609 if each program can support a community's needs.

1610 **FEDERAL EMERGENCY MANAGEMENT AGENCY (FEMA) PROGRAMS**

1611 The federal government has numerous grant programs available that can support community
1612 resilience improvements. [FEMA grant funds](#) are available for pre- and post- emergency or disaster
1613 related projects.¹⁰⁸ Some climate related FEMA resources are highlighted below:

1614 **Building Resilient Infrastructure and Communities**

1615 FEMA's [Building Resilient Infrastructure and Communities \(BRIC\)](#) funds capability- and capacity-
1616 building activities such as mitigation planning, project scoping and building code adoption; and
1617 mitigation projects that directly impact the natural and built environment. BRIC is funded from a six-
1618 percent set-aside of estimated disaster expenses for each major disaster (declared under the
1619 Stafford Act); the amount of available funding is described in the annual Notice of Funding
1620 Opportunity (NOFO). The NOFO also describes the current year's funding priorities. Local
1621 communities apply through the appropriate state, tribe, or territory. The [Bipartisan Infrastructure Law](#)
1622 [\(BIL\)](#) has provided an additional \$1 billion in program funding over five years (Fiscal Years 2022-
1623 2026). Under the [Justice40 Initiative](#), BRIC aims to deliver 40% of its overall benefits to
1624 disadvantaged communities that are marginalized, overburdened by pollution and underserved.

1625 For communities and Tribal Nations with limited resources, the [BRIC non-financial Direct Technical](#)
1626 [Assistance](#) is available. This assistance, provided for up to 36 months, helps local and tribal
1627 jurisdictions to reduce disaster damage, build community resilience and sustain successful
1628 mitigation programs. The wide-ranging Direct Technical Assistance includes climate risk
1629 assessments, community engagement, partnership building, hazard mitigation and climate
1630 adaptation planning.

1631 **Flood Mitigation Assistance**

1632 FEMA's [Flood Mitigation Assistance \(FMA\) Grant](#) is focused on reducing or eliminating repetitive flood
1633 damage to buildings insured by the National Flood Insurance Program through mitigation planning
1634 and projects. FMA's annual NOFO describes the amount of funding available in a given year, which
1635 fluctuates as it is based on Congressional appropriations. The NOFO also describes the priority
1636 scoring criteria, which usually includes consideration of climate change and future conditions. Local
1637 communities apply through the appropriate state, tribe, or territory. The [BIL](#) provided an additional
1638 \$3.5 billion in program funding over five years (Fiscal Years 2022-2026). Under the [Justice40](#)
1639 [Initiative](#), FMA aims to deliver 40% of its overall benefits to disadvantaged communities that are
1640 marginalized, overburdened by pollution and underserved.

¹⁰⁸ For more information on FEMA grants, see <https://www.fema.gov/grants>.

1641 **Safeguarding Tomorrow Through Ongoing Risk Mitigation Program**

1642 The Safeguarding Tomorrow Through Ongoing Risk Mitigation Program is a capital loan program,
1643 similar to the Clean Water Act revolving loan fund, that allows grant recipients to provide loans for
1644 zoning and land-use planning. Communities must contribute funds to be eligible; they will receive a
1645 reduced interest rate to undertake projects. Interested communities should consult their State
1646 Hazard Mitigation Officer about upcoming training and webinars. For more information, see
1647 [Safeguarding Tomorrow Revolving Loan Fund Program](#).

1648 **Rehabilitation of High Hazard Potential Dam (HHPD) Grant Program**

1649 FEMA's [Rehabilitation of High Hazard Potential Dam \(HHPD\)](#) grant program provides technical,
1650 planning, design, and construction assistance in the form of grants for rehabilitating eligible high
1651 hazard potential dams. High hazard potential is classification standard for any dam whose failure or
1652 mis-operation will cause loss of human life and significant property destruction. A state or territory
1653 with an enacted dam safety program, the State Administrative Agency, or an equivalent state agency,
1654 is eligible for the grant.

1655 **DEPARTMENT OF TRANSPORTATION (DOT) PROGRAMS**

1656 **Promoting Resilient Operations for Transformative, Efficient, and Cost-saving**
1657 **Transportation Program**

1658 The [BIL](#) provided \$7.3 billion in formula funding to states and \$1.4 billion in competitive grants to
1659 eligible entities “to increase the resilience of the transportation system.” Eligible projects include
1660 evacuation routes, coastal resilience, making existing infrastructure more resilient or efforts to move
1661 infrastructure to nearby locations not continuously impacted by extreme weather and natural
1662 disasters.

1663 **DOT Thriving Communities Program**

1664 The [Thriving Communities Program](#) aims to ensure that disadvantaged communities adversely or
1665 disproportionately affected by environmental, climate, and human health policy outcomes have the
1666 technical tools and organizational capacity to compete for federal aid and deliver quality
1667 infrastructure projects that enable their communities and neighborhoods to thrive.

1668 **Rebuilding American Infrastructure with Sustainability and Equity (RAISE) Grant Program**

1669 The [RAISE Grant program](#) provides an opportunity to obtain funding to build and repair road, rail,
1670 transit, and port projects. RAISE grants are eligible to a wide range of applicants, including special
1671 purpose districts and transit agencies, along with traditional state, local, tribal, and territorial
1672 governments. Funding is split between urban and rural areas.

1673 **DEPARTMENT OF HOUSING AND URBAN DEVELOPMENT (HUD) PROGRAMS**

1674 **Community Development Block Grant**

1675 HUD's [Community Development Block Grant](#) (CDBG) program supports the development of stronger
1676 and more resilient communities. Investment support may include infrastructure, economic
1677 development projects, public facilities installation, community centers, housing rehabilitation, public
1678 services, clearance/acquisition, etc. The CDBG program also includes targeted funding for post-
1679 disaster recovery and hazard mitigation.¹⁰⁹

1680 **ENVIRONMENTAL PROTECTION AGENCY (EPA) PROGRAMS**

1681 **Environmental Justice Thriving Communities Grantmaking**

1682 The [Environmental Justice Thriving Communities Grantmaking Program](#) is a competition to select
1683 multiple Grantmakers around the nation to reduce barriers to the federal grants application process
1684 communities face and increase the efficiency of the awards process for environmental justice grants.

1685 **Wildfire Smoke Preparedness in Community Buildings**

1686 The EPA's [Wildfire Smoke Preparedness in Community Buildings Grant Program](#) supports enhancing
1687 wildfire smoke preparedness in community buildings. The program provides grants and cooperative
1688 agreements to States, federally recognized Tribes, public pre-schools, local educational agencies,
1689 and non-profit organizations for the assessment, prevention, control, or abatement of wildfire smoke
1690 hazards in community buildings and related activities.

1691 **DEPARTMENT OF HEALTH AND HUMAN SERVICES (HHS) PROGRAMS**

1692 **Low Income Home Energy Assistance Program**

1693 Health and Human Services' [Low Income Home Energy Assistance Program](#) seeks to mitigate
1694 extreme heat impacts by providing funding to grant recipients for cooling assistance, summer crisis
1695 assistance, year-round crisis assistance, and weatherization. In addition, help for maintaining air
1696 conditioning use during a heat event can be obtained through the program, which provides federally
1697 funded assistance to reduce the costs associated with home energy bills.

1698 **NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION (NOAA) PROGRAMS**

1699 The National Oceanic and Atmospheric Administration maintains a list of [Climate Resilience Funding](#)
1700 [Opportunities](#). While not comprehensive, this website is regularly updated with funding opportunities
1701 that may support climate risk mitigation and resilience-building activities for SLTT governments.

¹⁰⁹ HUD also provides eligible grantees with direct grants for use in developing Indian and Alaska Native communities through the Indian Community Development Block Grant. For more information on this grant and other tribal specific federal funding opportunities, see https://www.hud.gov/program_offices/public_indian_housing/ih/tribal_climate_resilience_and_adaptation_funding.

The Bipartisan Infrastructure Law (BIL) and Inflation Reduction Act (IRA)

1702

1703

1704

1705

1706

1707

The [Bipartisan Infrastructure Law \(BIL\)](#) of 2021 and [Inflation Reduction Act \(IRA\)](#) of 2022 marked two pieces of landmark legislation that provide unique funding opportunities for clean energy, climate adaptation, infrastructure resilience, environmental justice, and much more. Funding opportunities for several federal agencies are listed below, though many more can be found using the [BIL Guidebook](#) and [IRA Guidebook](#).

1708

1709

1710

1711

- FEMA programs received \$6.8 billion in funding from the [BIL](#), with funding allocated to BRIC, FMA, Dam Safety, and other grant programs. In addition, the IRA provides financial assistance for investments in low-carbon materials, which is available through FEMA's Public Assistance, Hazard Mitigation Grant Program, and BRIC programs.

1712

1713

1714

- The [BIL](#) and [IRA](#) allocated over \$6 billion to NOAA programs. Some highlights include: \$1.47 billion in funding for coastal resilience ([Climate-Ready Coasts](#)); \$592 million for the [protection of fisheries](#); and \$575 million for the [Climate Resilience Regional Challenge](#).

1715

1716

1717

- Nearly \$10 billion in combined funding from the BIL and IRA is available via EPA programs ([summarized here](#)). Funding is available for projects to mitigate greenhouse gas emissions, reduce climate pollution impacts, and advance environmental justice initiatives.

1718

1719

1720

- Nearly \$35 billion in combined BIL and IRA funding was allocated to the Department of Interior. Funding is available for ecosystem restoration, drought mitigation, landscape conservation, and includes targeted funding (\$13 billion) for Tribal communities.

1721

1722

1723

- Health and Human Services created the [Quickfinder for Leveraging the IRA for the Health Sector](#) to help the health sector identify grants, loans, and tax credits that can be used to fund resilience and renewable infrastructure.

1724

Post-Disaster Funding Provided by Federal Agencies

1725

1726

1727

This section details post-disaster program funding from federal sources. FEMA operates several post-disaster recovery and mitigation programs that provide an opportunity for communities to address climate risk mitigation and resilience building.

1728

FEMA POST-DISASTER FUNDING

1729

Public Assistance Program

1730

1731

1732

1733

1734

1735

FEMA's [Public Assistance \(PA\) program](#) provides supplemental grants to SLTT governments and certain types of private non-profits so communities can quickly respond to and recover from major disasters or emergencies. Through the PA program, FEMA provides supplemental federal grant assistance for debris removal, emergency protective measures, and the restoration of disaster-damaged, publicly owned facilities and specific facilities of certain private non-profit organizations. The PA program also encourages protection of these damaged facilities from future incidents by

1736 providing assistance for hazard mitigation measures. Potential applicants can apply within 30 days
1737 following a Presidential disaster declaration. FEMA’s PA funding will cover no less than 75 percent of
1738 the project’s cost.

1739 **Hazard Mitigation Grant Program (HMGP)**

1740 FEMA’s [Hazard Mitigation Grant Program \(HMGP\)](#) provides funding to SLTT governments to rebuild in
1741 a way that reduces, or mitigates, future disaster losses in their communities. This grant funding is
1742 available after a Presidentially declared disaster. In 2021, FEMA made \$3.46 billion of HMGP
1743 funding available to SLTT governments specifically to address the impacts of climate change. HMGP
1744 funding can be used for mitigation planning, post-disaster code adoption and enforcement, and
1745 mitigation projects that address any natural hazard. The amount of HMGP funding available to a
1746 state, tribe or territory is based on the estimated total federal assistance provided under a
1747 presidential disaster declaration. States, tribes and territories determine mitigation priorities, which
1748 differentiates HMGP from BRIC and FMA, where the priorities are set by FEMA. Local communities
1749 and private non-profits apply through the appropriate state, tribe or territory.

1750 **HMGP Post-Fire Program**

1751 The [HMGP Post-Fire program](#) is structured largely the same way as HMGP, with the main exception
1752 being the source of funding. HMGP Post-Fire is available to states, tribes and territories affected by
1753 fires that result in a Fire Management Assistance Grant (FMAG). FEMA determines annually how
1754 much funding will be available based on a rolling 10-year national average of assistance provided
1755 under FMAG declarations and determines an allocation to affected states, tribes and territories.
1756 FEMA also sets the funding priorities, with the highest priority being wildfire and post-wildfire
1757 mitigation activities such as defensible space, erosion control and slope failure prevention in
1758 affected counties or tribal lands.

1759 **DOT POST-DISASTER FUNDING**

1760 **Federal Highway Administration (FHWA) Emergency Relief (ER) Program**

1761 FHWA administers the [Emergency Relief \(ER\) Program](#) for emergency repair or reconstruction
1762 projects on the Federal-aid highway system needed “as a result of 1) natural disasters or 2)
1763 catastrophic failures from an external cause. The applicability of ER funds is based on the extent and
1764 intensity of the disaster and the severity of the highway damage. The damage must be severe, occur
1765 over a wide area, and result in unusually high expenses to the highway agency. ER funds may be
1766 used on repairs that “improve the long-term resilience of the Federal-aid highways, if 1) the design is
1767 consistent with current standards, or 2) the State DOT demonstrates that the resilience feature is
1768 economically justified to prevent future recurring damage.¹¹⁰

¹¹⁰ FHWA, “Integration of Resilient Infrastructure in the Emergency Relief Program,” Memorandum from Hari Kalla, Associate Administrator for Infrastructure and Gloria Shepard, Associate Administrator for Planning, Environment, and Realty to Associate Administrators, Division Administrators, and Directors of Field Services. October 11, 2019. <https://www.fhwa.dot.gov/specialfunding/er/191011.cfm>.

1769 **Funding Provided by State and Local Governments**

1770 Adapting to climate change is often a local or regional pursuit. State and local governments play an
1771 important, and growing, role in the financing and funding of adaptation projects. While many states
1772 have authorized grant programs or financing authorities, the funding of resilience and adaptation
1773 projects through local financing remains important. The [Local Elected and Appointed Official
1774 Guide](#)¹¹¹ is a great resource for developing bond issues, special assessments, and/or taxes for
1775 application to resilience programs.

1776  **Case Study: Climate Protection Fund**

1777 On November 3, 2020, the people of the City and County of Denver voted in favor of raising the
1778 local sales and use tax by 0.25 percent to create the Climate Protection Fund. This fund, which
1779 is expected to raise up to \$40 million per year, is dedicated to eliminating greenhouse gas
1780 emissions and air pollution, supporting climate adaptation, and creating new jobs to improve
1781 the lives of community members. Its efforts focus on the communities most harmed by climate
1782 change: low-income households, communities of color and Indigenous people, babies,
1783 children, pregnant women, the elderly, people with disabilities, people with access and
1784 functional needs, and people with chronic health conditions.

1785 Source: [https://www.denvergov.org/files/assets/public/climate-action/documents/cpf/climate-protection-fund-
1786 qa.pdf](https://www.denvergov.org/files/assets/public/climate-action/documents/cpf/climate-protection-fund-qa.pdf).

1787 **STATE GRANT PROGRAMS**

1788 States have implemented a wide variety of grant programs with funding for climate resilience and
1789 adaptation, including traditional infrastructure (e.g., transportation, stormwater, wastewater), green
1790 infrastructure, wildlife and biodiversity conservation, flood management, drought, heat waves, and
1791 many other outputs. Some programmatic examples include: the [Virginia Community Flood
1792 Preparedness Fund Grant](#), which was established to help Virginia’s communities mitigate the
1793 impacts of flooding; the California Environmental Protection Agency’s [Environmental Justice Grants](#),
1794 which offer funding opportunities to non-profit community organizations and Tribal governments to
1795 address environmental hazard impacts; and New York’s [Climate Smart Communities Program](#), which
1796 provides broad funding to communities for both climate mitigation and climate adaptation.

1797 As there are an ever-increasing number of grant programs, [FEMA’s Recovery and Resilience
1798 Resource Library](#) is a useful resource for finding new funding opportunities, along with other
1799 information and tools to help craft a strong grant proposal.

¹¹¹ FEMA, *Local Elected and Appointed Official Guide: Roles and Resources in Emergency Management*, 2022, https://www.fema.gov/sites/default/files/documents/fema_local-elected-officials-guide_2022.pdf

1800 **STATE-AUTHORIZED FINANCING**

1801 Beyond direct grants to local governments, some states have passed legislation empowering local
1802 governments to establish districts or authorities whose purpose is to fund resilience projects. For
1803 example, in May of 2020 the Maryland General Assembly passed SB 457, which allowed local
1804 governments to create [Resilience Authorities](#) that can establish a diverse arrange of financing for a
1805 range of resilience-oriented projects. The authorities can issue bonds, levy fees for services, or rely
1806 on government or nonprofit contributions, among other funding streams. In turn, they have a wide
1807 array of powers (other than eminent domain) to build, acquire, manage, or operate infrastructure and
1808 resilience projects.

1809 California [AB 733](#), enacted in 2017, similarly authorized local governments in the state to create
1810 enhanced infrastructure financing districts specifically for climate adaptation projects. Given the
1811 broad hazards and impacts associated with climate change, this law provides flexibility for local
1812 governments to invest in projects adapting to flooding, drought, and heat waves, as well as the
1813 spread of infectious diseases and other public health impacts.

1814 **Private and Philanthropic Funding**

1815 A variety of private and philanthropic funding is available to SLTT communities in climate risk
1816 mitigation, resilience and adaptation program design and planning. For instance, many large
1817 corporations maintain philanthropic programs which may provide monetary support for climate risk
1818 mitigation and resilience building programs. Elected and appointed officials can be helpful in making
1819 introductions to business leaders and helping to broker funding for these projects. Planners should
1820 consider the value a business may receive from their funding: safer and more resilient communities
1821 for their employees, less risk to their operations, or public relations benefits.

1822 Many nonprofits with explicit climate-related risk mitigation and resilience building missions exist
1823 across the country. Some focus on specific issues such as wetlands or ocean conservation,
1824 sustainable commerce, climate change action, education or renewable energy demonstration and
1825 deployments. For example, the Wildlife Conservation Society operates a [Climate Adaptation Fund](#)
1826 that focuses on investment and innovation in adapting wildlife and ecosystems to climate change.

1827  **Case Study: Groundwork Jacksonville**

1828 In 2021, [Groundwork Jacksonville](#) was awarded \$294,000 from National Fish and Wildlife
1829 Foundation, with support from NOAA and AT&T, earmarked for the preliminary (30 percent)
1830 design of the Hogans Creek restoration. The goal of the resilience project is to reduce flooding,
1831 improve water quality, restore habitat, and provide access to recreation in and around the
1832 creek.

1833 The number of nonprofit philanthropic organizations offering funds related to climate-related risk
1834 mitigation is rapidly growing. Many of these organizations are members of the [National Voluntary
1835 Organizations Active in Disaster](#), making this a good starting point for exploring nonprofits offering

1836 climate resilience project funding. The [Georgetown Climate Center's Adaptation Clearinghouse](#) is
1837 another great resource, where users can search for funding or financing opportunities and filter by
1838 region or locality, focal sector, or jurisdictional focus.

1839

DRAFT

1840 Appendix D: Glossary

- 1841 ▪ **Adaptation:** Adjustment in natural or human systems to a new or changing environment that
1842 takes advantage of beneficial opportunities or moderates negative effects.
- 1843 ▪ **Cascading Impacts:** Cascading impacts from extreme weather/climate events occur when an
1844 extreme hazard generates a sequence of secondary events in natural and human systems that
1845 result in physical, natural, social, or economic disruption, whereby the resulting impact is
1846 significantly larger than the initial impact.
- 1847 ▪ **Climate:** Climate is determined by the long-term pattern of temperature and precipitation
1848 averages and extremes at a location.
- 1849 ▪ **Climate Change:** A change in the state of the climate that can be identified by changes in the
1850 mean and/or variability of its properties and that persists for an extended period, typically
1851 decades or longer. Climate change may be due to natural internal processes or external forcings
1852 such as modulations of the solar cycles, volcanic eruptions, and persistent human-driven
1853 changes in the composition of the atmosphere or in land use.
- 1854 ▪ **Climate Mitigation (“Mitigation” also “Greenhouse Gas [GHG] Mitigation”):** Measures to reduce
1855 the amount and speed of future climate change by reducing emissions of heat-trapping gases or
1856 removing carbon dioxide from the atmosphere.
- 1857 ▪ **Climate Projection:** The simulated response of the climate system to a scenario of future
1858 emission or concentration of GHGs and aerosols, generally derived using climate models.
1859 Climate projections are distinguished from climate predictions by their dependence on the
1860 emission/concentration/radiative forcing scenario used, which is in turn based on assumptions
1861 concerning, for example, future socioeconomic and technological developments that may or may
1862 not be realized.
- 1863 ▪ **Climate Resilience:** The capacity to anticipate, prepare for, respond to, and recover from
1864 significant multi-hazard threats with minimum damage to social well-being, the economy, and the
1865 environment.
- 1866 ▪ **Community Risk Analysis:** Understanding potential risks and the actions needed to address those
1867 risks by answering the following: 1) Which threats and hazards may affect our community? 2) If
1868 they occur, what impacts would those threats and hazards have on our community? 3) Based on
1869 impacts, what capabilities should our community have in place?
- 1870 ▪ **Compound Weather/Climate Events:** The terms ‘compound events’, ‘compound extremes’ and
1871 ‘compound extreme events’ refer to the combination of multiple drivers and/or hazards that
1872 contributes to societal and/or environmental risk.
- 1873 ▪ **Emissions Scenarios:** Quantitative illustrations of how the release of different amounts of climate
1874 altering gases and particles into the atmosphere from human and natural sources will produce
1875 different future climate conditions. Scenarios are developed using a wide range of assumptions
1876 about population growth, economic and technological development, and other factors.
- 1877 ▪ **Environmental Justice:** The fair treatment and meaningful involvement of all people regardless of
1878 race, color, national origin, or income, with respect to the development, implementation, and
1879 enforcement of environmental laws, regulations, and policies.
- 1880 ▪ **Equity:** Equity is the consistent and systematic fair, just, and impartial treatment of all
1881 individuals, including individuals who belong to underserved communities that have been denied

- 1882 such treatment, such as Black, Latino, and Indigenous and Native American persons, Asian
1883 Americans and Pacific Islanders and other persons of color; members of religious minorities;
1884 lesbian, gay, bisexual, transgender, and queer (LGBTQ+) persons; persons with disabilities;
1885 persons who live in rural areas; and persons otherwise adversely affected by persistent poverty
1886 or inequality.
- 1887 ▪ **Frontline Community:** Communities or populations that have experienced systemic
1888 socioeconomic disparities, environmental injustice, or another form of injustice and are highly
1889 vulnerable to and will experience disproportionately high adverse impacts from environmental
1890 and climate injustice and inequitable climate actions.
 - 1891 ▪ **Future Conditions:** Future Conditions refers to the changing risk of natural disasters due to
1892 climate change, population patterns, land use, and community development.
 - 1893 ▪ **Global Warming:** Refers to the long-term increase in global average temperature as a result of
1894 human activity. Climate change encompasses global warming but refers to the broader range of
1895 changes that are happening to our planet.
 - 1896 ▪ **Greenhouse Gases (GHGs):** Gases that absorb heat in the atmosphere near the Earth's surface,
1897 preventing it from escaping into space. If the atmospheric concentrations of these gases rise, the
1898 average temperature of the lower atmosphere will gradually increase, a phenomenon known as
1899 the greenhouse effect. GHGs include, for example, carbon dioxide, water vapor, and methane.
 - 1900 ▪ **Hazard Mitigation:** any sustained action taken to reduce or eliminate the long-term risk to human
1901 life and property from hazards.
 - 1902 ▪ **Natural Hazards:** Source of harm or difficulty created by a meteorological, environmental, or
1903 geological phenomenon or combination of phenomena.
 - 1904 ▪ **Nature-Based Solutions:** Sustainable planning, design, environmental management, and
1905 engineering practices that weave natural features or processes into the built environment to
1906 promote adaptation and resilience.
 - 1907 ▪ **Resilience:** The ability to prepare for anticipated hazards, adapt to changing conditions, and
1908 withstand and recover rapidly from adverse conditions and disruptions.
 - 1909 ▪ **Risk:** Threats to life, health and safety, the environment, economic well-being, and other things of
1910 value. Risks are often evaluated in terms of how likely they are to occur (probability) and the
1911 damages that would result if they did happen (consequences).
 - 1912 ▪ **Underserved Communities:** Underserved communities are defined in Executive Order 13985 as
1913 populations sharing a particular characteristic, as well as geographic communities, that have
1914 been systematically denied a full opportunity to participate in aspects of economic, social, and
1915 civic life, as exemplified by the list in the preceding definition of “equity.”
 - 1916 ▪ **Vulnerability:** The degree to which physical, biological, and socioeconomic systems are
1917 susceptible to and unable to cope with adverse impacts of climate change.
 - 1918 ▪ **Weather:** The state of the atmosphere with respect to wind, temperature, cloudiness, moisture,
1919 pressure, etc. Weather refers to these conditions at a given point in time.
 - 1920

1921 **Appendix E: Acronyms**

1922	BIL	Bipartisan Infrastructure Law
1923	BIPOC	Black, Indigenous, and People of Color
